RHAPSODY

Brand & Design Guideline

Visual quick reference for partners, vendors & contractors

RHAPSODY · OCTOBER 2026 · FOR APPROVED EXTERNAL USE

How to use this guide

This is Rhapsody's visual system: logo, color, type, graphic devices (the dots and light glows), photography, buttons, and the common layout patterns — with the rules and correct examples for each. Work from these pages when producing anything that carries the Rhapsody brand.

Every example here is live HTML rendered from the real design tokens, so colors, type, and spacing are exact. Use the Contents below to jump to a section.

> **Master art is included with this package.** The approved logos, monograms, big-dot and scattered-dot device files are provided as separate SVG/PNG files in the accompanying `rhapsody-brand-assets` folder — use those masters as-is (never rebuild or restyle them). Anything not in the asset folder is available on request from your Rhapsody contact.

Contents

1 · FOUNDATIONS

Brand expression
Visual principles, AI direction, and decision hierarchy

Color palette
Palette, text color, accessibility, blue on navy, text on teal

Corners & shape
Pills are CTA-only; square-top / rounded-bottom module frames

Pathways
Color-coding paths and journeys; build vs automate as an example

Layout & spacing
Clear margin, the seam, module accent line

Typography
Type scale, eyebrows, two-tone headline, dates & lockups

2 · BRAND

Logo & wordmark

Navy-bar/blue on light, blue-wordmark/white-line on dark, monogram, lockups

3 · COMPONENTS

Buttons & CTAs
Pill buttons, primary/secondary, text links + arrow

Charts & graphs
Bar, line, stacked bar, donut, color order + rules

Partner logos (brackets)
Bracket treatment for partner logo walls

Quotes & testimonials
Quote card, testimonial, customer quote card

Stats
Number-led stat cards

Tables
Navy header, alternating rows, blue result column, status tags

Dot accents
Framing & diagram shapes, dot row accent

4 · GRAPHIC DEVICES

Devices at a glance
Every device: meaning, color lead, and when to use it

Dots overview
What the dots mean, field vs big dot, backgrounds & dot colors

Fluid dot pattern
Half-tone dot grid, fluid density gradient, registers & color-territory split

Big dot
Cropped anchor + companions, three variants, what the parts mean

Light devices
One Aurora glow — soft to flowing, movement allowed; navy only

5 · ICONOGRAPHY

Icon library
Reference set, drawing spec, icon tile, functional marks

6 · IMAGERY

Illustration
Retired illustration style, preferred replacements

Photography & portraits
Photo direction + portrait treatments

7 · PATTERNS

Hero badge graphics
Website hero badges: navy disc, thick brand ring, radiating dot halo — photo or illustration fill

Display ads
Blue-first display ad — logo-led, few large words, one action (one in-context example)

PowerPoint deck template
Official 2026 slide deck — downloadable master (.pptx)

Email signature
Employee signature: wordmark, teal divider, name lockup, certifications

Email template

Header banners (Aurora, big dot, photo), seam, single CTA, Pardot notes

Hero (type in context)

Light, dark & photography hero layouts with eyebrow, headline, CTA

Name lockup

Attribution: name, title, company; logo vs written name; portrait pairing

Social posts

1:1 posts + quote banner, one device per post

Product launch announcement

Launch unit: product name, Aurora glow, one CTA

8 · REFERENCE

Quick corrections log

Retired elements, and direction confirmed

Brand expression

Rhapsody should feel **technologically advanced, intelligent, precise, established, and human**. The visual system must communicate innovation without sacrificing the confidence and trust expected of healthcare infrastructure. AI should feel embedded in the system, not represented as novelty or decoration.

PRECISE, NOT PLAYFUL

Favor ordered systems, confident typography, controlled color, and intentional spacing over whimsical or decorative treatments.

ADVANCED, NOT SCI-FI

Signal modern technology through data, connection, orchestration, product UI, and abstract system imagery rather than futuristic clichés.

HUMAN, NOT JUVENILE

Use credible real people and professional environments. Avoid cartoon-like characters, cute metaphors, or illustration styles that reduce enterprise credibility.

CONFIDENT, NOT LOUD

Let white space, hierarchy, and a restrained palette carry the brand. Do not add color or devices merely to fill open space.

Color

Rhapsody Blue is the primary color, used most prominently. Rhapsody Navy, light blue, and teal are secondary. Purple and orange are **restricted tertiary accents**, not general-purpose layout colors. A standard Rhapsody layout should usually contain no tertiary colors at all. Full-page backgrounds stay white, Rhapsody Blue, or Rhapsody Navy; light gray and gray-blue are for content modules, not full-page fills.

Palette

PRIMARY

Rhapsody Blue
Primary
#1A81F4 · RGB 26 129 244
Print: CMYK 100 50 0 0

Rhapsody Blue in print. Any print use of Rhapsody Blue must use **CMYK 100 50 0 0**. Don't let a layout program auto-convert the hex (a raw #1A81F4 conversion comes out muddy); set the swatch to **C100 M50 Y0 K0** explicitly. Keep HEX/RGB for digital.

SECONDARY

Rhapsody Navy
Secondary
#0B2C47

Light blue
Secondary
#B4D8FF

Teal
Secondary
#23C5BF

TERTIARY ACCENTS

Purple
Tertiary
#7340E4

Orange
Tertiary
#FA7E2E

TERTIARY COLORS ARE RESTRICTED

Purple and orange are reserved for controlled accents, exceptional emphasis, and data visualization where necessary. Do not use either as a general section color, headline color, CTA color, background theme, pathway color, or decorative fill.

NEUTRALS

Black	Dark gray	Light gray	Gray-blue	White
Neutral #050F19	Neutral #7E858C	Neutral #D9DFE6	Neutral (backgrounds) #E8EDF2	Neutral #FFFFFF

Text color

Body copy uses only **white, Rhapsody Navy, or black**. Work down the list in order.

- **Rhapsody Navy is the default text color.** On light backgrounds, set body copy and headings in Rhapsody Navy (#0B2C47) rather than black. Navy is the on-brand dark and clears contrast on white easily.
- **Black is a fallback, not a default.** Reach for black (#050F19) only when navy fails a contrast requirement, or in print that can't reproduce navy (single-color or limited-ink jobs). Otherwise, navy.
- **Rhapsody Blue is the accent on light.** Use it for emphasis, links, and one accent word in a headline, not for running body copy.
- **On dark backgrounds, text is white.** For blue accents on navy, the two blues split by size—see "Rhapsody Blue on navy" below.
- **No tertiary color in type:** teal, purple, and orange are never used for body copy, headings, eyebrows, or labels. Two exceptions: **on navy**, teal may set an eyebrow, label, small icon, or actionlink (6.7:1 on navy — see Teal in small applications below), and an H3 may take a **secondary** color where contrast allows (navy on light; light blue or teal on dark). On light grounds there is no teal type of any kind: automation actionlinks stay Rhapsody Blue, and the teal cue is carried by a nearby accent (module accent line, tick, seam). H1, H2, body copy, and captions stay within the copy colors above.
- **Dark gray for supporting text.** Dark gray (#7E858C) is allowed for secondary/supporting copy on white —subheads, support lines, captions—where a softer, de-emphasized read is wanted. Body copy still stays navy or black.
- **Color spaces:** digital uses HEX or RGB; print uses CMYK or Pantone. For print, Rhapsody Blue is **CMYK 100 50 0 0** (set it explicitly, don't auto-convert the hex).

DEFAULT PALETTE HIERARCHY

Most layouts should use **White/Navy + Rhapsody Blue**, with **one optional secondary accent** (Light Blue or Teal) only when needed. No more than three brand colors per layout, and reaching the maximum is not a goal. Purple and Orange do not count as freely available third colors; they appear only where another rule explicitly authorizes them. The multicolor fluid dot pattern and data visualizations remain controlled exceptions.

NO CUSTOM GRADIENTS

Brand color is applied flat. Don't create or add gradients—no color-to-color blends, ramps, or fades in backgrounds, fills, type, or shapes. The one approved exception is the soft glow of the **Aurora** light device (see Light devices); reach for it anywhere a gradient might feel warranted, and nowhere else.

Color accessibility

Accessibility requirements depend on the type of content. Use the thresholds below and then apply the brand-usage rules; a color pairing that technically passes contrast is not

automatically an approved Rhapsody treatment.

- **Normal text:** minimum contrast ratio **4.5:1**.
- **Large text:** minimum **3:1** (approximately 24px regular, or 18.5px bold and above).
- **UI components and meaningful graphic elements:** minimum **3:1** against adjacent colors.
- **Decorative graphics:** contrast requirements do not apply only when the element conveys no information.

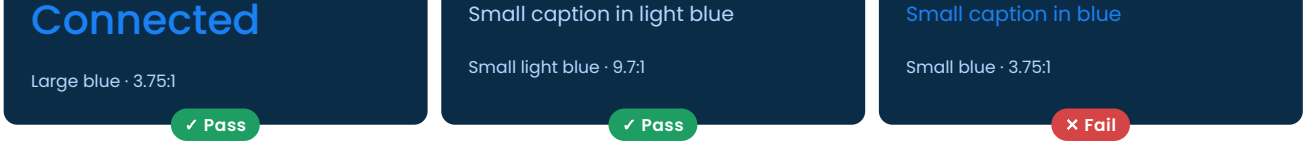

APPROVED COLOR-PAIR MATRIX

Foreground	Background	Status	Usage
Navy	White / light neutral	APPROVED	Default headings and body copy.
Navy	Gray-blue	APPROVED	Default headings and body copy. Use when you need to create alternate sections to break up content in a layout. (White background is always primary; gray-blue background is secondary.)
White	Navy	APPROVED	Default copy on dark surfaces.
Rhapsody Blue	White	APPROVED	Links, short emphasis, and approved headings; not running body copy.
Light Blue	Navy	APPROVED	Dark-ground accent and supporting type where size/contrast requirements are met.
Teal	Navy	APPROVED	6.7:1 — the only ground where teal carries type: eyebrows, labels, actionlinks, small icons.
Rhapsody Blue	Gray-blue	CONDITIONAL	Use only at a size that meets the applicable contrast threshold.
Rhapsody Blue	Navy	CONDITIONAL	Large graphics only (bars, blocks, big dots), not text — default to light blue for type on navy. Designer override for a specific case where blue text reads well.
Teal	White / gray-blue	NEVER	2.1:1 at any size — and never darken teal to force a pass; there is one teal. Use a teal accent beside navy text instead (see Teal in small applications).
White	Teal	NEVER	Fails contrast at 2.1:1. Larger type does not fix it.
Navy / Black	Teal	NEVER	Passes accessibility but is not visually appealing.

Brand rule beats contrast-only possibility. Do not use Purple or Orange for body text, headings, eyebrows, labels, or CTA copy just because a particular pairing passes a contrast test. Tertiary color restrictions still apply.

Rhapsody Blue on navy

On navy (`#0B2C47`), **default to light blue (#B4D8FF) for text** — it reads about 9.7:1 and stays legible at any size, including the two-tone headline highlight. **Don't set text in Rhapsody Blue on navy:** at 3.75:1 it only clears large sizes, and next to other colors on the dark ground it reads weak. Keep Rhapsody Blue on navy for **large graphics**, bars, blocks, and big dots, not type. A designer may override for a specific case where blue text genuinely reads well.

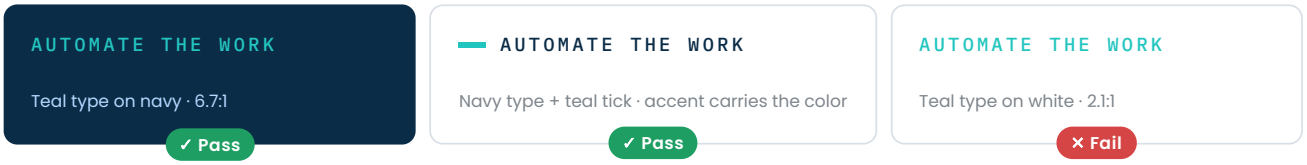

WHEN TO USE WHICH ON NAVY

- **Light blue on navy:** all text — headlines, body copy, captions, labels, accent and secondary lines, the two-tone headline highlight, thin rules, small icons, and small dots. This is the default for anything that reads as type on navy.
- **Rhapsody Blue on navy:** large graphics only — bars, blocks, big dots, and sizable brand shapes where the blue stays vibrant. Not for text.
- **Designer override:** blue text on navy is allowed only where a designer judges it genuinely reads well in a specific layout; otherwise light blue.

Teal in small applications

Small teal elements on light grounds keep failing contrast checks, and the common "fix"—darkening the teal—creates an off-brand second teal. The rule that prevents it: **when a teal application fails contrast, change the ground or the role, never the hex.** Teal (#23C5BF) reads at **6.7:1 on navy** (passes at any size) and **2.1:1 on white** (fails at any size), so the ground decides the role.

THE RULES

- **One teal.** #23C5BF is the only teal. Never darken, tint, or theme-convert it to pass a contrast check — a "fixed" teal is an off-brand color.
- **Teal type lives on navy.** Eyebrows, labels, actionlinks, and small icons may be teal on navy (6.7:1). This is the only ground where teal carries type.
- **On light grounds, teal is an accent, not a message.** Use the teal tick (a 16×3px bar before a navy label), the module accent line, the teal seam, a pathway top edge, or structured dots. The text beside it carries the meaning in navy; the accent carries the color. Links stay Rhapsody Blue.
- **Meaningful teal graphics on light** (a chart series, a status mark) need direct navy labels so nothing rides on the teal alone; add a thin navy keyline if the shape must read crisply at small sizes. Purely decorative teal (seams, ticks, dots, device glows) is exempt from contrast thresholds.

TEAL IS IMMUTABLE

If a teal application fails an accessibility check, the hue is never the thing that changes. Move the element to navy, or demote the teal to an accent beside navy text. One teal, everywhere, always #23C5BF.

Test pairings with the WebAIM Contrast Checker or the EightShapes Contrast Grid.

Corners & shape

Two different rounded shapes do two different jobs, keep them separate. The **fully rounded pill is for CTAs only** (see Buttons and CTAs). **Rounded corners are welcome for framing content**, modules, cards, charts, callouts, and image frames, across webpages, PowerPoint slides, and editorial layouts. The recommendation below is how we do that most on brand.

RECOMMENDED: SQUARE THE TOP, ROUND THE BOTTOM

For framing modules and components, **square off the top two corners and round the bottom two.** The sleekest, most on-brand frame: engineered at the top, settled at the base. Use it as the default frame for content blocks, and keep the treatment consistent across a page or deck.

Module frame

Squared top, rounded bottom (12px).

✓ Recommended

Default for content blocks.

Chart / uniform

All four corners rounded (12px).

✓ Also fine

Charts and dense grids where a uniform frame suits.

Over-rounded

Pill-like radius on a module.

✕ Off-brand

The full pill radius is for CTAs only.

- **Pill (`border-radius: 999px`) = CTAs only.** Never frame a module, card, chart, or image with it.
- **Module frame:** square the top two corners, round the bottom two to about **12px** (`border-radius: 0 0 12px 12px`). All four corners rounded (~12px) or fully square is also fine, for example charts and dense grids.
- **One treatment per page or deck**, don't mix squared-top frames with fully rounded ones in the same view.

Pathways

Rhapsody color-codes distinct paths so a user always knows which one they are on. Give each path or journey its own color and carry it as a wayfinding cue across every surface, so the color itself signals the path. This is a foundation for theming any set of parallel journeys, not a one-off section accent.

THE DIRECTIVE

Assign each path a color and hold it end to end, across a page, a deck, a nav branch, a whole journey. Carry it as the cue wherever a surface belongs to the path: the module accent line, the eyebrow, in-context links and buttons, diagrams, and section theming. Default to blue when a surface is neutral or spans paths.

How to assign path colors

- **One color per path, held across its journey.** A path reads the same color everywhere it appears, page, deck, and nav branch, so the cue stays predictable.
- **Assign in a fixed order** so coding stays consistent as paths are added: blue → teal → purple → orange → light blue → navy.
- **Default to blue** for neutral surfaces, or ones that span more than one path.

Assign in order and hold each path's color across its whole journey.

WHERE THE CUE APPEARS

- **Website and navigation.** Path landing pages and their sections theme to the path color, so moving into a branch is visible at a glance.
- **Module accent line.** Takes the path color (see Layout and spacing for the device spec).
- **Eyebrows and links.** In-context kickers, text links, and the CTA arrow take the path color. **Feature icons stay in the blue family** (navy, Rhapsody blue, light blue), never the path color, so the cue is carried by the accent line, eyebrow, and links, not the icons. On white, a light path color like teal drops to the line only; keep teal copy off white (see Color, Text on teal).
- **Content and diagrams.** Path-specific decks, one-pagers, and diagrams carry the color consistently end to end.

Example: Build and Automate

The clearest current application is the two Rhapsody pillars, the first two colors in the sequence. **Build the infrastructure** is **Rhapsody Blue**; **Automate the work** is **Teal**. It shows the system in practice: each pillar holds its color across its whole journey, on the website, in path-specific content, and in section theming.

BUILD THE INFRASTRUCTURE

AUTOMATE THE WORK

Build on proven interoperability.

Path color: Rhapsody Blue **#1A81F4**. The blue accent line, eyebrow, links, and icons signal a build surface.

Automate the work around the data.

Path color: Teal **#23C5BF**. Teal cues the automate surface through the line; the eyebrow and heading stay navy.

Do

- Give each path one color and hold it across its full journey, page, deck, and nav branch.
- Default to blue for neutral surfaces or ones that span paths.
- Add colors in the fixed order only when a genuine new path exists.
- In the pillar example, keep Build blue and Automate teal wherever the two appear together.

Don't

- Swap or mix path colors, or switch a path's color mid-journey.
- Set teal, or any light path color, as small copy on white; the cue is the line or fill.
- Invent a new color for a path, or reorder the sequence.
- Theme a neutral, cross-path surface to one path's color.

Layout and spacing

Layouts should always breathe. A few simple rules keep graphics and documents clean and consistent.

Margins and padding

Margins are the empty safe zone at the outer edge of a composition or page. **Padding** is the breathing room around and between the objects inside it, graphics, charts, images, text boxes, and callouts. They are set separately, and the right amount differs by application.

OUTER MARGIN (THE SAFE ZONE)

For a self-contained graphic, a hero, ad, or social post, keep a clear margin of about **6 to 7 percent of the shorter side**, with no copy, photo, or logo inside it (roughly a 40px margin on a 600px-wide graphic, scaling proportionally). That figure is correct for single graphics; multi-page documents follow their application's page-margin convention instead.

- **Web:** use 6–7% for self-contained graphics. Responsive page containers use a consistent gutter of about **24–40px** on desktop and **16–20px** on mobile.
- **PowerPoint (16:9):** keep all content inside a safe margin of about **0.4–0.5in** from every slide edge (roughly 5–6% of the 7.5in height). Align titles and footers to that same margin.
- **Word and print documents:** use standard page margins of about **1in** (never below 0.75in). Document margins are intentionally wider than the 6–7% graphic rule; don't shrink them to match it.

OBJECT PADDING (SPACE AROUND AND BETWEEN OBJECTS)

Every object, a chart, image, table, text box, or callout, keeps clear space around it so nothing touches or crowds. Hold a consistent minimum:

- **Web:** at least **16–24px** between objects and between an object and nearby text; container/card inner padding at least 16–24px.
- **PowerPoint:** at least **0.2–0.3in** between objects and between an object and its title or caption.
- **Word:** at least **0.1–0.15in** of wrap spacing around figures and tables, with a blank line above and below.
- Never let a graphic, dot pattern, or glow touch or run under text; keep that gap at least the outer margin.

Rule of thumb: the 6–7% figure is the outer safe margin for a single graphic. Padding between objects is a separate, smaller gutter that keeps a busy layout legible. When in doubt, add space.

Text alignment

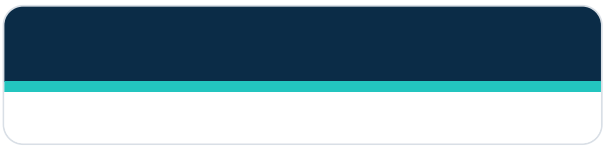

Default copy to left alignment. A consistent left edge is easiest to scan, so body copy, captions, lists, and any multi-line label set flush left. **Center alignment is the exception**, reserved for a short header, eyebrow, or single-line callout where centering genuinely reads better, never for running copy or anything that wraps to more than a line or two.

Separator line (the seam)

The seam is a tool to **break up color blocking**: a thin rule that marks the boundary where **two sections of different colors meet**, such as a navy band above a white body on a hero or email header. That is its rule, **it must separate two different-colored sections**; never run

a seam inside a single color field or on a standalone piece (an ad or social post) where there is no color change. Keep it thin and full-width.

The seam color is **teal, Rhapsody blue, navy, or light blue** — pick the one that stays distinct from *both* sections it divides. Teal is the common choice where a navy band meets a light body; on a white or light band, Rhapsody blue (preferred for digital) or navy reads cleanly; light blue works as a quiet seam on navy.

Teal seam on a navy band (default).

White band: Rhapsody Blue (or navy) seam.

Module accent line (H2 sections)

Section modules led by an H2 open with a short horizontal accent line set directly above the heading, or above the eyebrow where one is present. It signals the start of a new content module and gives each section a consistent, engineered entry point.

- Dimensions: **44px wide × 3px tall**, 2px corner radius. One per module, tied to the primary H2, never repeated on sub-cards or stretched full-width.
- Spacing: sits above the eyebrow/H2 with about 20–22px below it before the heading.
- **Color follows the pathway** (default to blue for neutral surfaces), applied to the line only. Hold one accent color across a whole activation. The full color logic lives in **Pathways**.

Typography

Poppins is the primary typeface; **IBM Plex Mono** (weights 400 and 500) is the support face, for eyebrows and technical annotations (see below).

- **Fallback — Arial** wherever Poppins can't load, notably email (most clients won't render Poppins) and some documents and devices. Set the stack `'Poppins', Arial, sans-serif` and design so the layout still holds in Arial. Never bake copy into an image just to force the font.
- **One weight for the hierarchy** — H2–H4 and all body copy in **Poppins Regular (400)**; the hero and H1 step up to **Poppins Medium (500)** for a little more presence.
- **Medium (500) also handles** small emphasis (labels, buttons) and short standalone "moment" headlines (see Stronger headlines for moments).

Type scale

The scale is identical on light and dark backgrounds. The numbers below are the CSS `font-weight` values for web.

ON LIGHT

Hero · Medium 500 · 60px	Hero headline
H2 · Regular 400 · 40px	Section heading
H3 · Regular 400 · 20px	Subheading
P1 · Regular 400 · 16px	Body copy
P2 · Regular 400 · 11px	Caption

ON NAVY

Hero · Medium 500 · 60px	Hero headline
H2 · Regular 400 · 40px	Section heading
H3 · Regular 400 · 20px	Subheading
P1 · Regular 400 · 16px	Body copy
P2 · Regular 400 · 11px	Caption

Stronger headlines for moments

The exception to the single-weight scale is a **short, standalone headline that marks a moment or a step in a journey** rather than leading a block of narrative copy. With only a few words and no supporting paragraph to lend it weight, a Regular headline reads thin, so step it up to **Poppins Medium (500)**. Reserve this for confirmation and milestone screens, a submitted form, a completed step, not for section or narrative headlines. Use one per screen, paired with a short Regular supporting line.

Do: Medium for a standalone moment

You're in!

Thanks for completing the survey. Watch your inbox for what's next.

Don't: Regular headline reads weak

You're in!

A few words in Regular float without a narrative around them.

Eyebrows (kicker labels)

The small label above a headline (the eyebrow or kicker) sets in **IBM Plex Mono**.

INTEROPERABILITY PLATFORM

Headline follows in Poppins

On light: IBM Plex Mono 500.

INTEROPERABILITY PLATFORM

Headline follows in Poppins

On dark: IBM Plex Mono 500.

- All caps, always.
- IBM Plex Mono Medium (500). Regular 400 is acceptable where 500 renders heavy at very small sizes.
- Size roughly 12–13px, sitting above the headline with clear space between.
- Add letter-spacing so the caps don't look cramped (see Leading & tracking for the value).
- Markup: usually a `<p>` or `<span>`, not a heading. Exception: on product or landing pages the eyebrow may be the `<h1>` (the product name) when that reads better for SEO than a longer, stylized hero headline.
- Avoid: Poppins for eyebrows, bold weight, and tight or absent letter-spacing.

Technical annotations (IBM Plex Mono)

Beyond eyebrows, IBM Plex Mono is the voice for small technical labeling: standards and data labels (FHIR, HL7, MCP, REST), technical captions under diagrams or code-adjacent visuals, and small technical UI accents such as ticker labels. Use weight 400 for running annotation text and 500 for emphasized labels, at caption sizes. It is a support face only: never body copy, headings, or buttons.

Implementation: load `https://fonts.googleapis.com/css2?family=IBM+Plex+Mono:wght@400;500&display=swap` and reference it via the token `--mono: "IBM Plex Mono", monospace;`.

Dates and times

When a graphic carries a date or a time, use these formats so event cards, webinar promos, and speaker graphics stay consistent. To attribute a person, see the **Name lockup** pattern.

- Dates: abbreviated month, no period: **Jan 4, 2026**. Ranges use a hyphen with no spaces: **Jan 1-4, 2026**.
- Times: lowercase **a.m./p.m.** with periods, hyphenated range, time zone after: **10-11 a.m. EST**.
- Multiple time zones separate with a pipe: **10-11 a.m. EST | 9-10 a.m. CST**.

Two-tone headline

In a two-tone headline, set **only the word or two you are emphasizing** in the accent color. Every other word, and the supporting description below, stays white or black depending on the background. On light backgrounds the accent is Rhapsody Blue (`#1A81F4`) against navy or black text. On dark backgrounds it is also **Rhapsody Blue at headline size**, where it stays vibrant on navy; drop to light blue (`#B4D8FF`) only when the accent is small. The description line never takes the accent color.

USE IT SPARINGLY

The two-tone headline exists to pull the eye to genuinely meaningful text. Highlight one idea per headline, and don't reach for it on every headline: if everything is

highlighted, nothing is. When in doubt, set the whole headline in a single color and save the accent for the moment that matters.

Health data, finally connected

On dark: at headline size the emphasis word is Rhapsody Blue; the rest of the headline and this description stay white.

Health data, finally connected

On light: the emphasis word is Rhapsody Blue; the rest and this description stay navy or black.

Do

- Color only the one or two words carrying the emphasis.
- Keep the rest of the headline, and the description, white (on dark) or navy/black (on light).
- Reserve it for headlines where the highlighted idea genuinely matters.

Don't

- Color the whole headline, or the description line, in the accent.
- Highlight several words, so the emphasis is diluted.
- Apply it to every headline across a layout or deck.

Leading & tracking

Line height (leading) and letter-spacing (tracking) keep the type feeling calm and open. Keep typography consistent by using the role-based settings below.

Text role	Line height	Tracking	Rule
Hero / H1	110%	Default (0)	Keep large headlines compact and intentional.
H2 / H3	120%	Default (0)	Use consistently across a layout.
Body	150%	Default (0)	Prioritize comfortable reading.
Caption / support	140–150%	Default (0)	Do not compress small text.
IBM Plex Mono eyebrow	120%	+0.16em	The deliberate exception for technical/all-caps labeling.

Do not manually tighten or loosen Poppins to make copy fit. Edit the copy, resize the type within the approved scale, or adjust the layout instead.

Minimum font size (web)

For legibility on screen, keep body and interface text at a readable minimum. These are floors, not targets, most body copy should sit comfortably above them.

- Body copy: at least 16px on web. This is the baseline for comfortable reading.
- Secondary and supporting text: at least 14px.
- Captions, labels, and fine print: at least 12px. Do not go below 12px for anything a user needs to read.
- Legal or disclaimer text: at least 11px, used only where unavoidable.

- Maintain at least 3:1 contrast for large text and 4.5:1 for normal body text, so size and contrast work together.

Logo

The Rhapsody wordmark is the core of the identity. Lead with the primary version wherever possible; the alternates exist for dark backgrounds, one-color use, and tight spaces.

Variations

Four versions across light and dark backgrounds: the full-color wordmark and a one-color version of each.

ON LIGHT

Primary: navy bar, blue wordmark. The bar is Rhapsody Navy (#0B2C47), not black.

One-color navy, for light or limited-color use.

ON DARK

Blue wordmark, white line. The two-color version for navy and dark backgrounds, at larger sizes only, about **240px / 2.25in wide and up**, where the Rhapsody-blue wordmark stays vibrant. Below that size, use the all-white version instead.

All white. The default on navy and dark backgrounds at smaller sizes, and for one-color or limited-color use.

Monogram

The R monogram, for tight spaces only, social avatars, favicons, merch. Light version on light backgrounds; for dark mode the blue R keeps its color with a white bar (matching the wordmark's blue letters and white accent). Never in place of the full logo in formal communications.

Logo rules

Clear space

Always keep clear space around the logo to protect its clarity. Use the height of the mark as the minimum clearance on all sides.

Minimum size, print

Never smaller than 1.5 in / 38.1 mm wide.

Minimum size, web and video

Never smaller than 108 pixels wide.

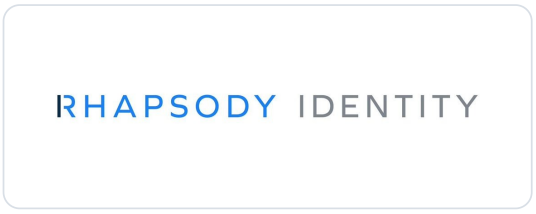

In short

- Navy bar and blue wordmark on light. On navy or dark backgrounds, use the blue-wordmark / white-line version at larger sizes; below the size threshold above, use the all-white wordmark.

- **Never the all-blue wordmark on navy at small sizes** (low contrast); drop to all-white.
- One-color navy or white for limited-color contexts.
- Always all capital letters. Maintain clear space. Use official logo files only.

Product logo

Product logos pair the Rhapsody wordmark with a product name in a fixed lockup, horizontal or vertical. Use only approved lockups, never create product-only wordmarks or alter the mark.

Horizontal lockup.

Vertical lockup.

Keep clear space of at least the height of the "R" on all sides. Mono, dark, and blue variants and all product names live in the product logo library (available on request from Rhapsody).

Co-branding lockup

For pairing the Rhapsody logo with a partner or customer logo, see **Partner logos**, which covers the co-branding lockup alongside the bracket treatment for logo walls and the rules for using another company's logo.

Logo restrictions

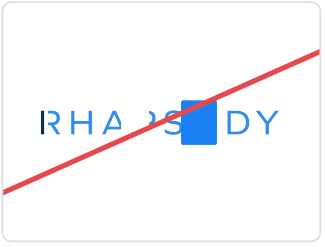

Use only the official logo files. Each example below is improper use, the red slash marks what to avoid.

Unapproved colors

Disproportionate resize

Modified mark (letters removed or redrawn)

Tilted or angled

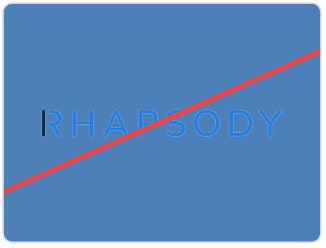

Outlined

Content over the logo

Low-contrast background

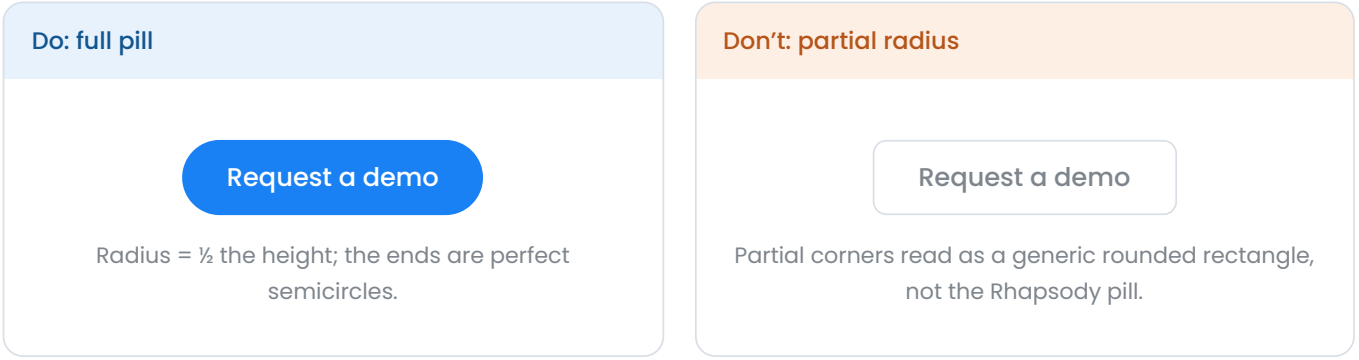

Download official logo files: Rhapsody logos are included in this package · product logos are available on request from Rhapsody.

Buttons and CTAs

Buttons are pill-shaped, set in Poppins Medium (500), sentence case, with a short action label like “Learn more” or “Request a demo.”

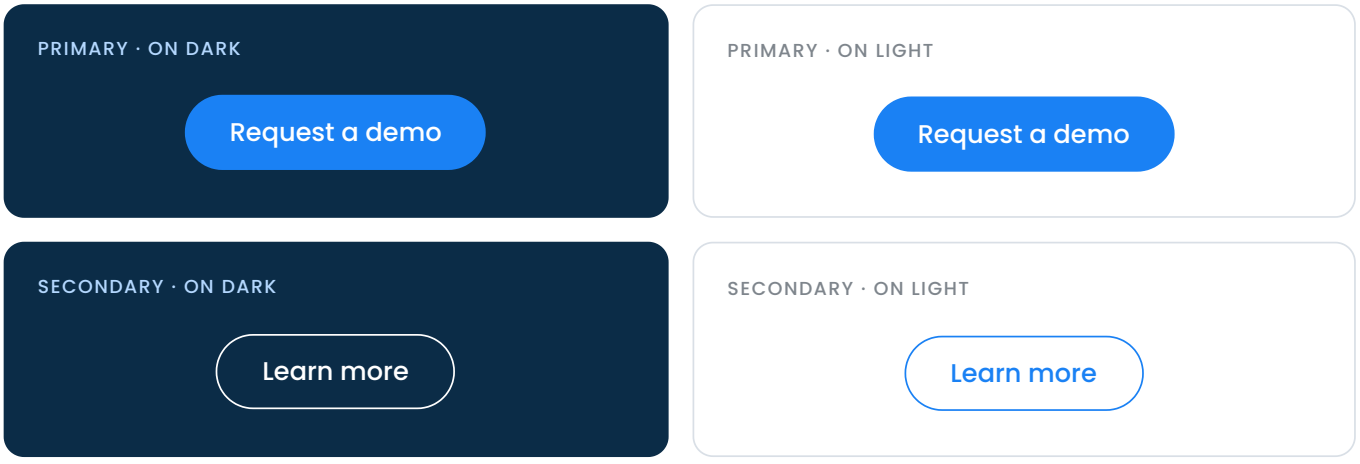

The pill shape

The pill is **fully rounded**: the corner radius equals half the button’s height, so the left and right ends are perfect semicircles. In CSS this is `border-radius: 999px` (any value at or above half the height produces the same full curve).

Primary and secondary

Primary is a filled pill and there is one per view: **Rhapsody Blue with a white label on light and dark grounds alike** (on navy the blue pill reads large and vibrant). The teal-filled pill is retired: it required a label set on teal, which the system no longer allows at any size. Secondary is the same pill as an outline, for a lower-priority action: white on dark, blue on light.

- Fully rounded pill (see The pill shape); never a partial-radius rounded rectangle.
- The pill radius is **exclusive to CTAs**: never use it to frame a module, card, chart, or image. For framing content, see Layout and spacing → Corners and shape.
- Poppins Medium (500), sentence case, no bold (700).
- Labels are short and action-led, and stay consistent through a flow.
- Keep to no more than three brand colors in the surrounding layout.
- Give buttons clear padding and space; do not place dots or graphics over them.

Text links and the CTA arrow

Text-style CTAs (“actionlinks”) end with a trailing right arrow (a leading space, then →), signaling forward movement into a deeper page. Pill buttons never take an arrow.

ON LIGHT

Explore the platform →

ON DARK

Learn more →

Do: arrow on a text link

See how SimonMed did it →

Don’t: arrow on a button

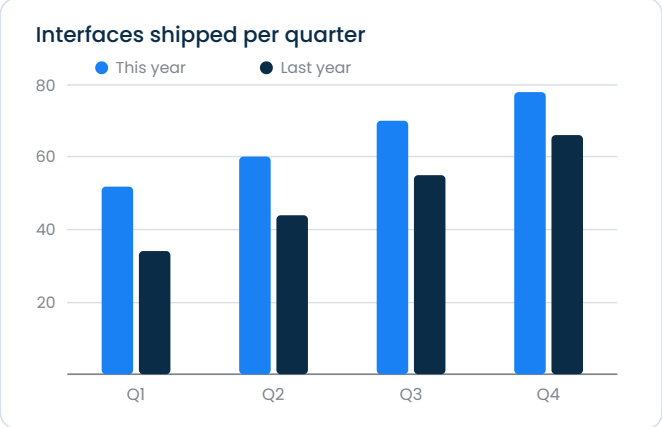

Book a demo →

- Text links only, “Explore …”, “Meet …”, “Learn more”, card CTAs, inline nav.
- Use the arrow character `→` (→), one per link, always trailing with a leading space, never `->`, », or an icon.
- The arrow takes the link’s color, which follows its ground: on light, links are Rhapsody Blue (teal type never sits on light grounds — see Color → Teal in small applications); on navy, white, light blue, or teal per context; never orange.

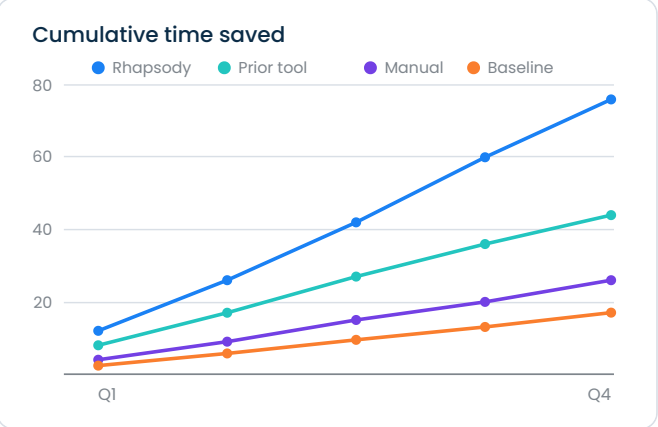

Charts and graphs

Data visuals follow the same rules as everything else: brand colors, generous space, and no decoration. Lead with the point.

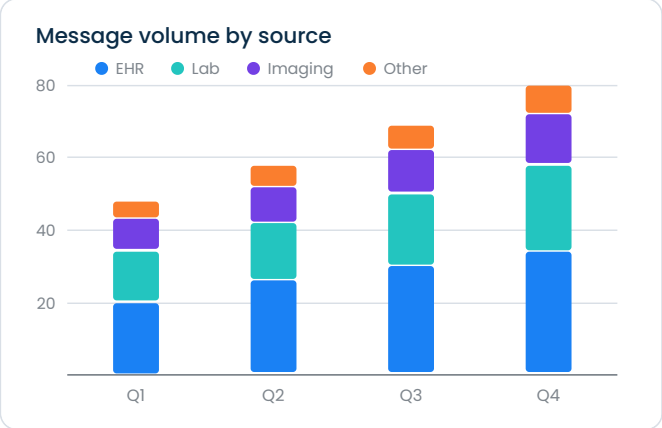

Charts and graphs

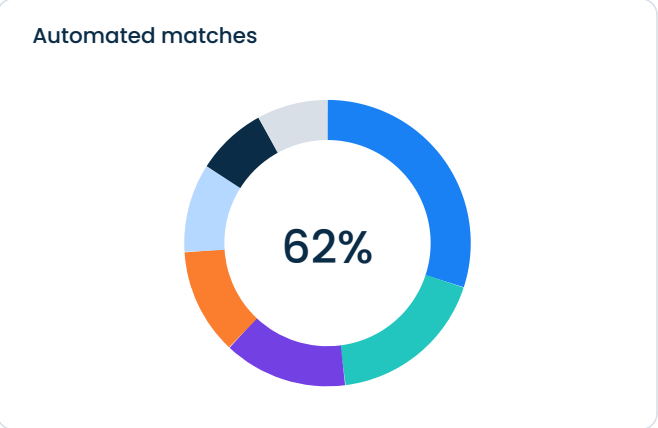

Grouped bar (two series): Rhapsody Blue paired with navy, light gridlines, navy title.

Line (three or more series): the order blue, teal, purple, orange, labeled directly.

Stacked bar: the order (blue, teal, purple, orange), only as many as the data needs; dark labels on the orange segment.

Donut: segments in order (blue, teal, purple, orange, light blue, navy); gray for the remainder; key number in the center.

Chart color order

Assign chart colors in the fixed order below so every chart reads as one system, adding only as many as the data needs. This data-series order matches the same color order as Pathways to promote design system consistency.

1 · Blue | 2 · Teal | 3 · Purple | 4 · Orange | 5 · Light blue | 6 · Navy | Gray · remainder

COLOR RULES IN CHARTS

- **Two series: Rhapsody Blue + navy,** the cleanest, highest-contrast pairing. Use it whenever a chart compares just two things.
- **Three or more: follow the order** blue, teal, purple, orange, light blue, navy, adding a color only when the data needs distinguishing.
- **Light blue is for fills and large areas** (bar, stacked, and donut segments), not thin lines or small marks on white, where it is too low-contrast. On navy it reads at any size.

- **Orange** is the fourth series color, and otherwise a sparing accent, never a whole palette of orange. Put dark (navy or black) labels on orange fills.
- **Purple** is the third series color; don't set purple as labels on navy or black.
- **Teal fills take dark labels only** (navy or black), never white.
- **Gray (#D9DFE6)** is the remainder or context series, and the gridline color. Titles navy, axis labels dark gray.
- Stay within the order and add a color only when the data needs distinguishing; charts are the one place the three-color rule relaxes.

Chart style

- No gradients, 3D, drop shadows, or heavy outlines. Data first.
- Label directly where possible; legends are fine when they aid clarity.
- Keep only the left (value) and bottom (category) axis lines. Drop the top and right sides of the plot frame so the chart isn't boxed in—those lines carry no data and just add clutter.

Partner logos

When to use customer and partner logos

A customer or partner logo is fine to use once you've confirmed it meets the checklist below. How you place it depends on the situation:

- **Two or more logos:** use the bracket treatment (the parenthesis device) so a mixed wall stays consistent in size and color.
- **A single customer logo:** it can stand alone in the layout.
- **A partner logo:** use the co-branding lockup (below) to place it alongside the Rhapsody logo, rather than on its own.

Bracket treatment for partner logos

To present a wall of customer or partner logos, place each logo between two curved brackets, echoing the connection motif without hard boxes. This keeps a busy multi-logo grid feeling refined and premium. The parenthesis device **brings Rhapsody branding to multi-logo layouts** and **gives logos of different sizes and shapes** (stacked versus horizontal) a consistent frame.

- Two thin single-color arcs, one on each side of the logo, like parentheses.
- Arc colors are blue, teal, and purple only. One color per logo.
- Alternate the three colors across the set so no two neighbors match.
- Place the partner logo in its own colors, centered and clear, between the arcs.
- **Fix one arc size for the whole wall.** The bracket is a shared frame, so every pair of arcs is identical in height, curvature, gap, and stroke weight—only the color changes. Pick the arc height once (the frame), then fit every logo to it.
- **Size the logo to the arcs, not the reverse.** Cap each logo's optical height to about **two-thirds of the arc height**, centered between the arcs with equal clear space above and below, and hold a consistent gap of about **10% of the arc height** between each arc and the logo so nothing touches.
- **Stroke weight:** thin and uniform, about **1/18 of the arc height** (roughly 5–6%), the same on every arc in the set.

Before using a partner or customer logo

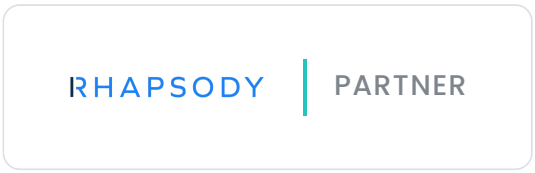

Before placing a partner or customer logo, verify all of the following:

- **Correct, current version.** Confirm it is the most recent, official version of the logo, not an outdated or unofficial mark.
- **Permission.** Confirm we have permission to use the logo.
- **High resolution.** The file is sharp at its display size, with no pixelation or artifacts.
- **Correct spacing.** It sits within the brackets with clear space per guideline; never crowded or stretched.

- **Transparent background.** Use a transparent-background file so the logo sits cleanly on the layout, never on its own white or colored box.

Co-branding lockup

When Rhapsody appears alongside a partner or customer logo, use a horizontal lockup: the Rhapsody wordmark, a thin teal divider, then the partner mark. The divider does the separating, so neither logo needs a box.

On light backgrounds.

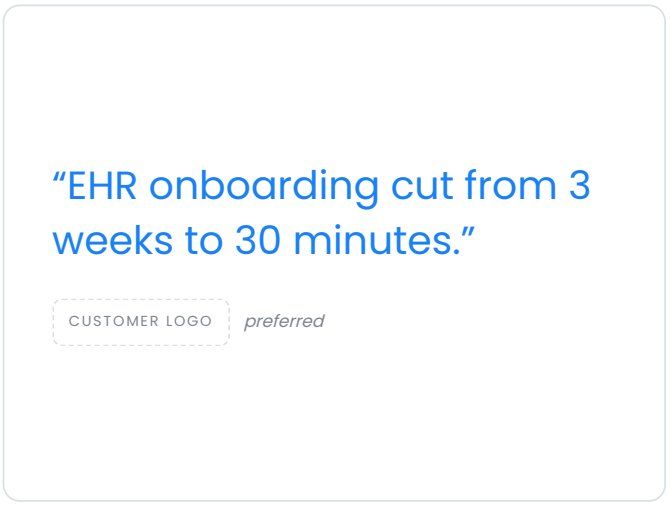

On navy or dark backgrounds.

- One thin teal divider, roughly the cap height of the wordmark. Never a box or rule around either logo.
- Equal clear space on both sides; balance the two marks by eye, not pixel-for-pixel.
- The lockup pairs Rhapsody with a single partner. To present a set of partner or customer logos together, use the bracket treatment above.

Quotes & testimonials

Proof points work hardest when they are short: cut quotes to a single powerful snippet and stats to the takeaway, then let the number or the line carry the weight.

Quote cut to one line in a brand color; attributed with the customer logo.

The name-only fallback: small caps when no usable logo exists.

Quotes

- **Reduce to one short, powerful line**—cut everything that is not the point. Caps: one-line snippets under 60 characters, longer testimonials under 120; if a quote needs more, it needs editing.
- Set it large using **primary or secondary colors only**, Rhapsody Blue or navy on light backgrounds, Rhapsody Blue on dark, never the tertiary purple or orange. Hold one accent color across a group of quotes or stats.
- Highlight in a Rhapsody-colored box with white text, or Rhapsody-colored text on white.
- **Attribution:** use the customer’s verified logo (accurate, current, high-res, transparent background) whenever we can; name the customer in small caps only when the logo can’t be used. For several logos, use the bracket treatment.
- Always wrap the quote copy in opening and closing quotation marks. An oversized decorative mark is an optional accent, not a substitute for them.

For a longer, single-customer testimonial presented as a landscape banner (with the quote on navy and a light device), see the **quote banner** in Social posts.

Customer quote card

For a single, named customer, pair one of the approved thin-ring portraits with a one-line quote. The face makes the proof human, the ring stays thin in a single brand color, and the name, title, and logo carry the attribution. Give the card generous white space.

“Rhapsody let us connect every system without slowing care.”

Dana Reyes
VP, Integration
Meridian Health

300M+

Patient records unified and deduplicated

CUSTOMER LOGO

62%

Matches automated, no human review

CUSTOMER LOGO

- Lead with the number or result. Cut the wordiness and get straight to the takeaway.
- Big number in Rhapsody Blue on navy/dark and on light, Poppins Medium; one short label beneath it.
- Attribute with the customer's verified logo wherever we can use it (these are customer-impact results); name the customer in small text, navy or light blue, only when the logo can't be used.
- Group several stats with consistent number size and spacing; keep to one accent color per set.

Tables

Tables use a navy header row with white text, alternating white and gray-blue rows, and thin light-gray dividers. Highlight the key column or result in blue. No heavy borders.

Metric	Before	After
Onboarding time	3 weeks	30 minutes
Interface build time	10 days	2 days
Unplanned downtime	Monthly	None in 1,000 days

When a table needs color

Most tables stay monochrome, because color-coding *data* is the charts' job, not the table's. The one case that calls for more color is a **status or category column**, where a small colored tag speeds scanning.

Interface	Messages / day	Status
Epic ADT	128,400	Live
Quest Labs	54,900	Degraded
Legacy RIS	0	Down

- Status tags are the one place a table carries several colors; hold them to that single column.
- Use functional colors for state (green live, orange degraded, red down) and one tag per row, dark text on the light orange fill.
- Everywhere else, let the blue result column do the emphasis; don't color-code whole rows or multiple data columns.

Dot accents

Beyond the fluid dot pattern and the big dot (see Graphic devices), the dots can be composed into small decorative accents. These are a lighter, more graphic use of the motif—not a substitute for the primary devices.

Framing and diagram elements

The dots can be composed into shapes, a ring, an arc, or a network, that frame content or carry a simple idea. Use them as decorative and structural accents in creative work: digital display ads, white papers and reports, banners, and slides. Here the dots are **always equal size, always multicolor but never orange**, and carry **no gradient fill**. A faint connecting line is allowed for a diagram, never a squiggle.

✓ On-brand
Ring

✓ On-brand
Arc

✓ On-brand
Network

Dot row accent

A short horizontal row of dots is an approved compact use of the dot motif, useful in banners and email headers where the full fluid pattern would be too much.

- A few dots, one uniform size, evenly spaced.
- Sequence through brand colors, for example teal, blue, light blue, purple.
- Use as a small accent, not a full field. Do not combine with the fluid dot pattern in the same layout.

Graphic devices at a glance

Rhapsody works from one connected family of visual devices. Each carries a distinct meaning and a recommended color lead, so the device reinforces the message rather than just decorating it.

The device system is intentionally limited. Fewer choices create a more recognizable, premium brand and make AI-generated work more consistent. **Usually lead with one visual expression per layout**, but the evolved devices can be combined with restraint when it genuinely helps (see below).

Device	Meaning	Why / when to use
Aurora	When everything comes together, harmony across the system. Allows movement.	The one light device, with range from a soft wash to a flowing form. Use for harmony, ease, and connected systems, and for motion, video, animated headers, and large backdrops. Navy or dark backgrounds only.
Fluid dot pattern	Scale and order, data resolving into one connected field.	Use to communicate data, infrastructure, scale, and systems working together. A half-tone dot grid that flows dense-to-sparse; best for larger compositions where the graphic can occupy its own visual space. Can also carry a two-tone color-territory split.
Big dot	Relationship and momentum, systems of every size connecting.	Use for simple, high-impact brand moments where a full graphic field would be too complex. Best for small or fast-read formats, hero moments, and compositions that need a strong visual anchor.
Photography	The human industry we serve, people first.	Use when people, expertise, collaboration, or real-world technology environments strengthen the story. Photography should make Rhapsody feel credible, modern, and human while balancing the more abstract graphic devices.

MASTER-ART RULE

Do not recreate or alter graphic devices. Use the approved SVG/PNG master art as provided.

COMBINE WITH RESTRAINT

Lead with one device by default, but the evolved devices **can work together when it makes sense:** a big dot alongside a photo, or the fluid dot pattern as a quiet background behind a photo, both pair well. **Don't overdo it**, two complementary elements at most, never a stack of devices competing for attention, and nothing placed over faces or copy. If a layout feels empty, prefer open space over adding decoration.

Dots overview

The dots are the **primary graphic device** for Rhapsody, and they carry the meaning of what we do. Each dot is a data point, a system, a person. Rhapsody works to **connect that data, clean it, and organize it**, and the dots tell that story: many separate points brought into alignment, resolving from scattered noise into an ordered, legible field. Used well, they signal connectivity, precision, and scale while adding texture and refinement.

HOW THE DOTS WORK

Pick a background, a color mode, and the composition. The main composition is the **fluid dot pattern**; at small sizes the **big dot** (one oversized dot resolving into a few) carries the same story. Each device has its own card (Fluid dot pattern, Big dot); the smaller decorative uses live in Dot accents. Whatever you choose, the dots stay to a corner or edge, cover no more than 50 percent of the space, and never overlap text.

Fluid pattern or big dot?

Device	What it says	When to use
Fluid dot pattern	Scale and order: many equal points resolving from noise into one aligned, legible field. The precise, infrastructure register, with a fluid dense-to-sparse flow.	Larger canvases with room to breathe, full or section backgrounds, web heroes, slide and report covers, booth graphics, where the pattern can dissolve gradually from its edge. Also carries a two-tone color-territory split.
Big dot	Relationship and momentum: systems of every size coming into connection, with Rhapsody as the anchor. The warmer, more human register.	Small, fast-read formats where a full field is too busy or too small to resolve, display ads, social tiles, thin banners, cover slides, plus hero and brand moments that want warmth.

Use **one device per layout**, never both, and never a dot device together with a light device.
The decorative dot accents (Dot accents) are a separate, lighter use.

Backgrounds and dot colors

Each fluid pattern and big dot is **built for one background** and is not interchangeable. The background sets which dot colors are allowed:

Background	Dot colors
Navy #0B2C47	White, Rhapsody blue, light blue, teal, purple, plus a maximum of 3 orange.
Rhapsody blue #1A81F4	**White only.**
White #FFFFFF	Navy, Rhapsody blue, light blue, teal, purple, plus a maximum of 3 orange.

Orange lives in multicolor only, never on a Rhapsody blue ground, and never more than 3 dots so it reads as a surprise. The dots are exempt from the three-color rule. Full detail for each device: **Fluid dot pattern** and **Big dot**.

Fluid dot pattern

One of the two dot devices; see **Dots overview** for when to use the pattern versus the big dot, and for the background → dot-color rules. The fluid dot pattern is a **half-tone dot grid**: identical dots on one grid that gather into a dense core at an edge or corner and **dissolve fluidly outward**, each dot easing from large to small so the field flows rather than stops. It carries the same meaning as before, many separate points resolving into one connected, legible field, in a more refined, fluid register. It never forms a recognizable object, symbol, letter, line, or shape.

A CLOSED, APPROVED FAMILY, USE IT, DON'T BUILD IT

The patterns are a **closed, approved set**, one for each background, anchor, and format, shipped as transparent SVG, 2× PNG, and on-ground JPG. Pick the file that fits and use it **as-is, flipped, or rotated 90°**. Do not hand-place a new pattern or restyle one, no recoloring, resizing individual dots, gradients, opacity, strokes, or non-proportional stretching.

Registers

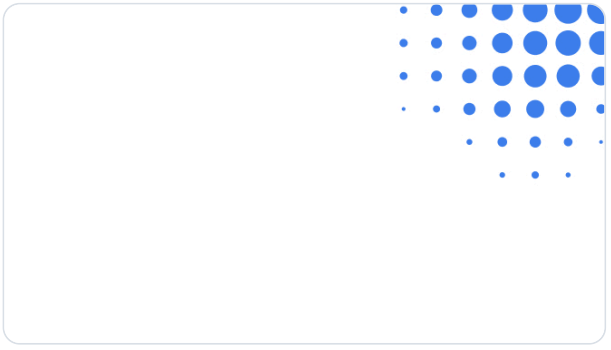

Each master is built for one background, which sets the dot colors (see Dots overview). Keep copy in the clear area opposite the dense core, and use one pattern per layout.

White on navy. The default dark register; core at a corner or edge.

White on Rhapsody blue. White dots only on a blue ground.

Dots on white. Navy or Rhapsody-blue dots on a light ground.

Multicolor on navy. Blue, light blue, teal, purple, white, plus up to three orange.

Color-territory split

The pattern also carries a **two-tone split**: the dense core meets a second color field along a soft diagonal, so the dots divide the composition into color territories **instead of a hard color block**. Use it to separate sections or pair the two pillars; keep copy clear of the dot transition.

Navy and white meet through the dot transition, a softer alternative to a straight color block.

THE RULES FOR THE FLUID DOT PATTERN

Clearance is the rule most often broken. No copy, headline, button, card, logo, or image sits on top of the pattern, and nothing crops one. Keep copy in the clear area opposite the dense core, cover no more than **50 percent** of the space, and use **one dot device per layout**, never two patterns, and never a pattern with the big dot or a light device.

At a glance: do and don't

On-brand

- An approved fluid pattern on white, Rhapsody blue, or navy, used as-is, flipped, or rotated 90°.
- Single color or multicolor; multicolor includes up to three orange dots.
- Dense core anchored to a corner or edge, with a clear gap from text.
- The one dot device in the layout; or the color-territory split to divide sections.

Off-brand

- Full-view takeover or more than 50 percent coverage.
- Hand-built grids, mixed dot sizes, or dots over text, faces, or the logo.
- Off-palette, outlined, or gradient-filled dots; recolored masters.
- Two patterns at once, or a pattern paired with the big dot or a light device.

Masters (transparent SVG + 2× PNG + on-ground JPG), used verbatim or flipped/rotated: Fluid Dot Pattern. The earlier scattered/structured dot field is retired (see Quick corrections log).

Big dot

The compact, high-impact form of the dot device (see **Dots overview** for when to use the big dot versus the fluid dot pattern). It is **one dominant circle cropped by two edges**, alone or with two to four smaller dots gathering and overlapping around it. The varied sizes are organizations of every scale, a large health system, a lab, a clinic, an app; the overlap is the point, separate systems no longer siloed but touching and exchanging, with **Rhapsody as the anchoring dot** the others connect around. The crop matters: a whole circle reads as a closed object, a bubble, pin, or logo mark; a cropped one reads as a network too large to fit in view, and forces a calm side for copy. Use it for **display ads, social tiles, thin banners, cover slides, and hero and brand moments**.

A CLOSED, APPROVED FAMILY, USE IT, DON'T BUILD IT

Like the field, the big dots are a **closed, approved set**—one for each background, placement, format, and the three variants, as transparent SVG and 2× PNG. Use one **as-is, flipped, or rotated 90°**; never hand-build or restyle it.

The anchor color and its companions are set by the background and are not interchangeable. The anchor is **never the background hue, and never purple or orange** (purple and orange are accents that stay on the companions): on navy, a Rhapsody blue anchor with teal, light blue, and white companions; on Rhapsody blue, a teal anchor with white, light blue, and purple; on white, a light blue anchor with Rhapsody blue, purple, and navy.

Three ways to use it

Solo, anchor only. For small or dense surfaces.

Default, anchor + 2–4 companions.

Outlier, adds one orange dot: the next system, not yet connected.

WHAT THE PARTS MEAN

The parts map to the two-pillar story: the **anchor is Rhapsody**; **larger companions** are the systems it connects (Build the infrastructure); **smaller companions** are the agents across them (Automate the work); the **orange outlier** is the next system, not yet connected. Use the outlier at most once, and **omit it when the message claims completeness** ("every," "all," a finished total).

- **Anchor,** cropped by two edges (about 25–45% off-frame) so it's never a whole circle floating in the frame. Colors follow the background (above).
- **Companions,** 0 or 2–4, all different sizes. They may overlap the anchor but **never each other**; each stays a distinct, readable circle.
- **Flat fill,** perfect circles, no gradient, opacity, or stroke.

- **Copy on the calm side,** clear of the dots by at least one large-companion diameter; nothing sits on or crops the dots.
- **One device per layout,** the big dot or the fluid dot pattern, never both. Formats: 16×9 (cover slides, web hero, video), 1×1 (social tile), 9×16 (story, vertical video), and a 728×90 thin banner. See Display ads and Email template for it in use.

Masters (SVG + 2× PNG), used verbatim or flipped/rotated: included in this package (`rhapsody-brand-assets/dot-devices`).

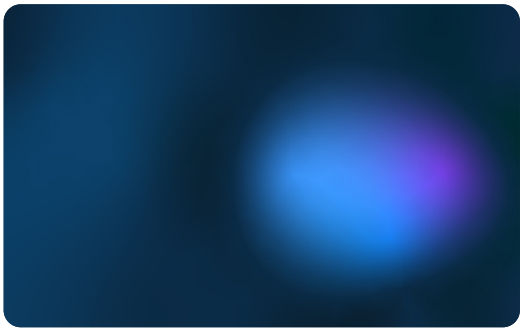

Light devices

Alongside the dots, **Aurora** is the light device, and the only one. Where the dots are precise and rational, Aurora is warm and human, together they say engineered, but human. It is a single device with range: from a calm, soft wash to a flowing band of light. **Aurora allows movement**, so the same device covers both still and moving work. Use it for photo-free digital moments like heroes, social, slides, and video.

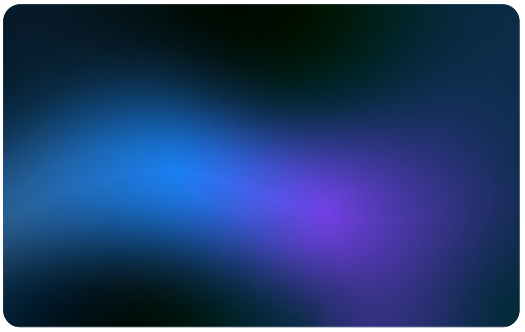

RULES FOR AURORA

Aurora sits on navy grounds only. On any other background, Rhapsody Blue, white, or a photograph, don't use a glow, use the dots device or photography instead. The glow uses **teal, blue, and purple only, never orange**, and stays within three colors. Offset the glow into open space so copy sits on the calm side of the composition, never on the brightest point.

ONE DEVICE, SOFT TO FLOWING

Soft wash. A calm, blended glow. When everything comes together, harmony across the system. The everyday register.

Flowing. A band of light with movement, for motion, video, animated headers, and large hero or event backdrops. The same Aurora, with more energy.

GLOW COLOR

Aurora is **teal-led** (see Devices at a glance), and can run through teal, blue, and purple. Within that, the exact blend is left to design, always within the **teal / blue / purple** glow palette, following the color hierarchy and staying legible on the navy ground.

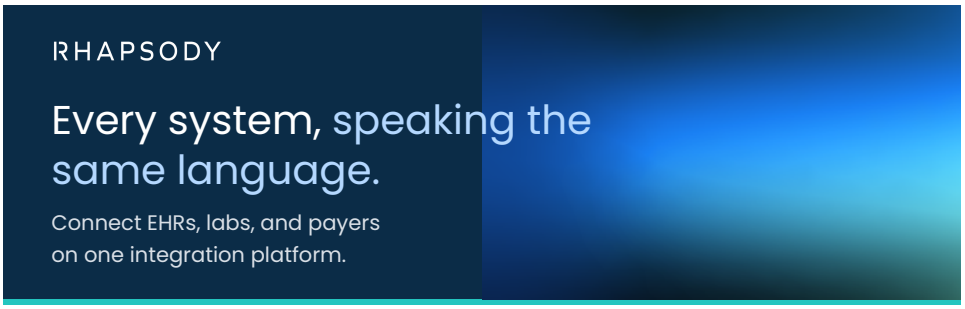

MOVEMENT

Aurora is allowed to move. For **motion and large-scale applications**, video, animated headers, and large hero or event backdrops, lean into the flowing form, where it has room to move and is **not hugging copy**. It is a great way to suggest our AI capabilities, modern, fluid, and seamless, without being literal. For everyday layouts, banners, and anywhere text sits close, keep to the calmer wash.

Master files for Aurora (soft and flowing; transparent PNG and on-navy JPG): AuroraGlow.

AURORA IN USE

Aurora leads a layout with the copy on the calm side, clear of the glow. The banner below shows Aurora on navy; the same glow leads the **Social posts** quote banner and the **Product launch announcement**.

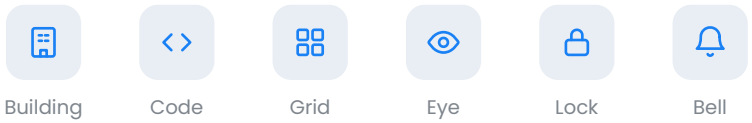

Banner (Aurora): a calm wash offset right, copy on the calm left, teal seam on the bottom edge.

- Teal, blue, purple only; never orange.
- Navy grounds only. Digital hero, social, slide, and video atmosphere. Not behind photography, and not a universal print element.
- Maintain a clear margin of about 6 to 7 percent of the shorter side around the composition.
- Use one graphic device, dots or Aurora, per layout, not both at once.

Icon library

Rhapsody uses a single, consistent family of **outline (line) icons**: simple geometric shapes drawn as strokes, not filled shapes. The reference implementation is the feature-card icon set on the “How we compare” page (building, code brackets, grid, eye, lock, bell). Think Lucide / Feather style: clean, minimal, single-weight.

The reference set

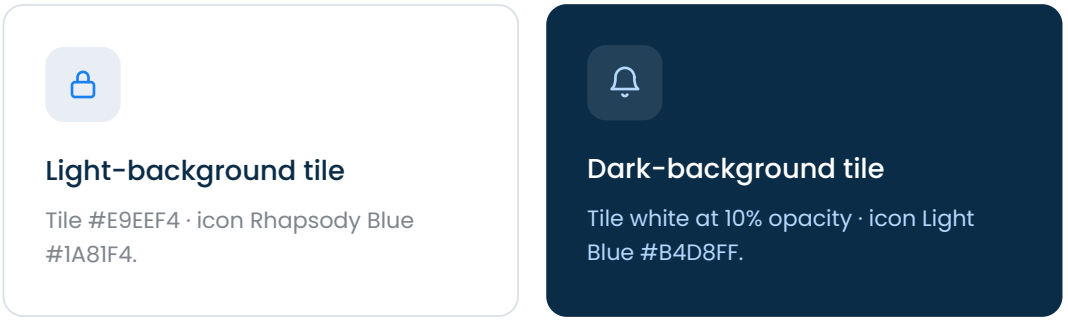

Icon drawing spec

- Canvas: 24×24 viewBox.
- Style: `fill="none"`, stroke only. Never use filled/solid glyphs or duotone.
- Stroke: `stroke-width="1.7"`, rounded line caps and joins (`stroke-linecap="round" stroke-linejoin="round"`).
- Color: set stroke to `currentColor` so the icon inherits the surrounding text/context color and adapts automatically (blue on light, white or light on dark). Do not hardcode hex on decorative icons.
- One concept per icon; keep detail minimal so it stays legible at small sizes.

The icon tile

Feature and benefit icons always sit in the approved 44×44 rounded-square tile with an 11px corner radius. The icon renders at 22×22, centered. Use exactly one of the two treatments below; do not invent alternate tile colors or use uncontained icons for features/benefits.

- Use the light treatment on white, light gray, and gray-blue surfaces.
- Use the dark treatment on Rhapsody Navy and other approved dark surfaces.
- Icons remain in the blue family only; never teal, purple, or orange.
- Functional marks such as checks/crosses remain the exception below.

Functional marks

Yes/no indicators in comparison tables are the exception to the tile treatment: a check in Rhapsody blue (`#1A81F4`) and a cross in muted gray (`#7E858C`), both at stroke-width 3 for weight. These are UI marks, not decorative icons, and don’t sit in tiles.

Don’ts

- No mixing icon families.
- No varying stroke weights within an icon set.
- No drop shadows or gradients on icons.
- No emoji as icons.

Legacy two-color icons in the Rhapsody icon library (available on request from Rhapsody) are for existing assets only; new work uses the outline family above.

Illustrations

The previous character-driven illustration style is retired for new work. It does not support the more mature, technology-forward position Rhapsody needs with enterprise buyers, partners, and investors.

Prefer

- Real photography and credible technical environments.
- Product/interface imagery and software shown in context.
- Data visualization, architecture diagrams, and system maps.
- Approved graphic devices.

Avoid

- Cartoon people, whimsical scenes, cute metaphors, or character-driven spot illustrations.
- Generic robot heads, glowing brains, humanoid AI figures, circuit-board faces, or hologram clichés.
- Decorative sparkles or “AI magic” motifs used without a specific brand-system reason.

Photography

Imagery reflects a modern SaaS company serving a high-stakes, regulated, human industry. Show the systems, teams, technology, and software environments that make care possible, not hospital care itself. The overall impression is confident, open, collaborative, technically credible, and current.

TECHNOLOGY CREDIBILITY

Balance human imagery with credible technical context: integration teams, developers, enterprise environments, product interfaces, system monitoring, collaborative technical work, and data infrastructure. Avoid relying on generic smiling-office photography as the only human expression of the brand.

PEOPLE COME FIRST

Photography is a **co-equal brand expression, not decoration**. Real people, teams, and faces should carry our work as much as any graphic device. When a layout could hold either a person or an abstract device, **lead with the person**: the dots and glows are the accent to a human story, not a replacement for it. **Proportion cue:** across a page, campaign, or deck, people should lead at least as often as a device.

Approved library examples: forward-facing, genuine, modern workspaces, inclusive across roles and ages.

Use

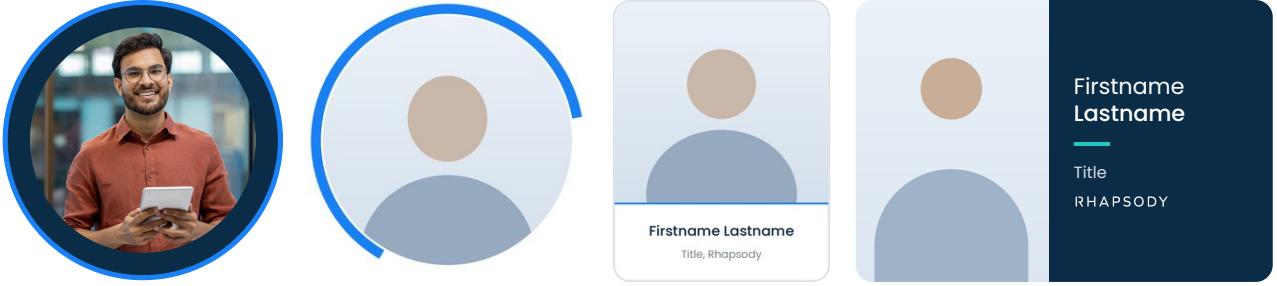

- People facing the camera or each other, eye contact, active discussion.
- Faces sharp and eyes visible; soft, even lighting.
- Inclusive representation across roles, ages, and identities.
- Modern workspaces with visible data or code; bright, natural light.
- Clean backgrounds and consistent color temperature across a page.

Avoid

- Dark, dim, or tech-noir treatments.
- Motion blur or soft-focus faces.
- Harsh light flaring toward the camera.
- Backs to camera, staged handshakes, stiff poses.
- Literal hospital-care scenes; overly retouched or generic stock.

Portrait treatments

For real people, employees, webinar speakers, and customers, use one of these treatments, the approved standard for portraits.

Brand ring. Arc accent. Rounded-rect card. Editorial split.

- **Default to the brand ring:** a bold navy ring with a thin Rhapsody-Blue outer edge, the website-hero weight, around a circular crop (the same family as **Hero badge graphics**). For an accent variant, swap the outer edge to **one brand color per portrait, primary or secondary only**, chosen for contrast against the background, Rhapsody Blue or navy on light grounds, light blue or teal on dark. **Never the tertiary purple or orange.** Hold the one color consistent across a set.
- Bright, forward-facing photo, cropped to face and shoulders, on a clean light background, with generous white space.
- Keep the ring clean and even all the way around. Avoid white rings, drop shadows, or busy backgrounds behind the portrait.

Hero badge graphics

The hero badge is Rhapsody's signature treatment for website heroes, product pages, and market-segment pages. It takes the dots device and resolves it into a **radiating halo** around a **navy disc** held by a **thick Rhapsody-Blue ring**. The disc carries either a person (photo) or a product / segment (illustration), and small icon badges can tag what the system does. It is the same family as the portrait ring, scaled up into a full brand moment.

BUILT FROM THE DOTS

The halo is the fluid dot pattern bent into a circle, dense at the ring and fading outward with no hard edge. The badge is a focal device, one per hero, that lets a photo or illustration sit inside the brand system instead of floating on its own.

The master treatment

Established on the website heroes. Treat it as the reference for ring weight, the navy band, the halo falloff, and badge placement.

Anatomy

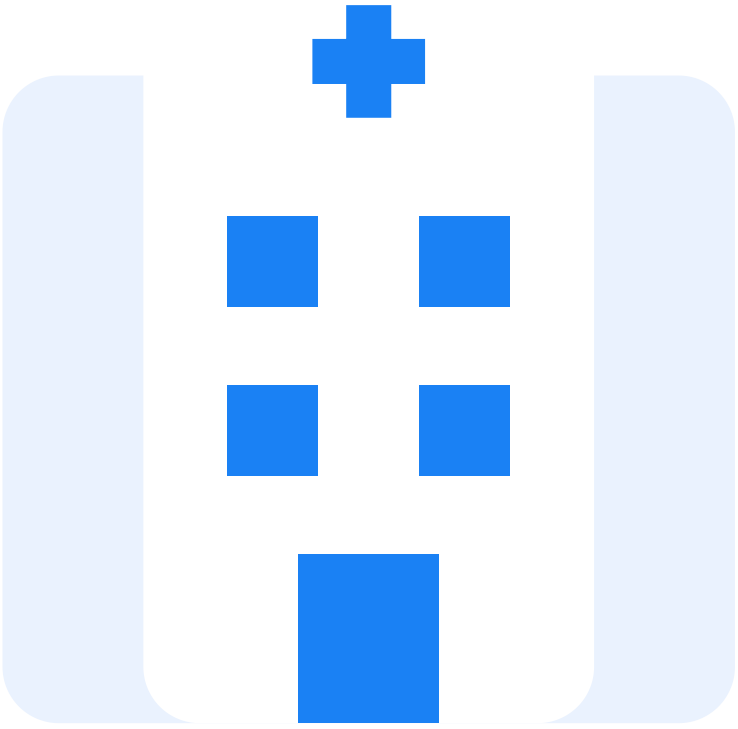

- **Ring.** One circle: navy fill (`#0B2C47`) with a Rhapsody-Blue stroke (`#1A81F4`). The stroke reads as a bold navy band with an **~8px blue outer edge**. Keep it even all the way around.
- **Fill.** A circular crop centered in the disc. For photos, leave a navy band (~10% of the photo diameter) between the photo edge and the ring. For illustrations, the artwork sits directly on the navy.
- **Dot halo.** Light blue (`#B4D8FF`) half-tone dots on a light ground, dense next to the ring and **fading out radially** — never a square or cropped edge.
- **Icon badges (optional).** Small circles on the ring that tag a capability. Two per badge at most, placed at opposite corners, clear of the face.

Two fills

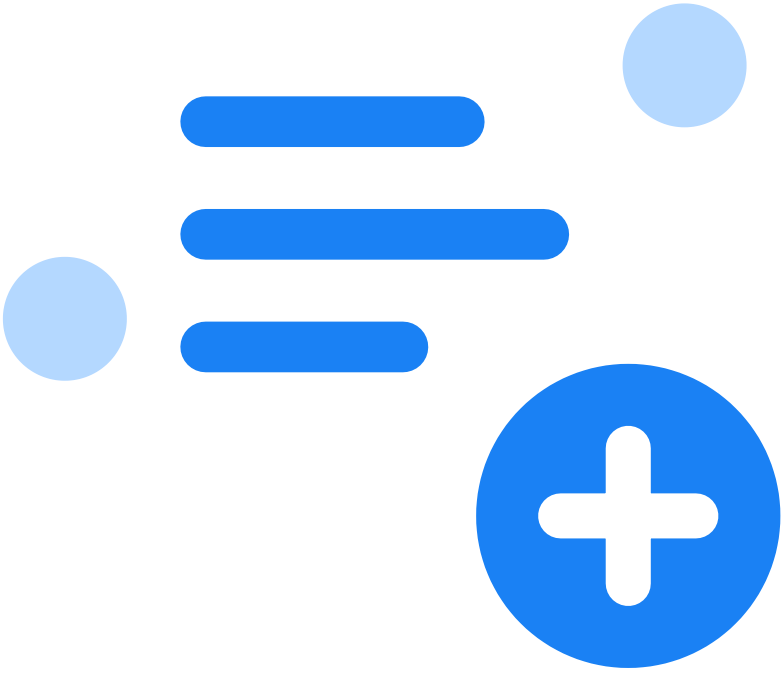

One badge system, two jobs. **Photos** carry people, customers, teams, and homepage heroes. **Illustrations** carry products and market segments, a single white-and-light-blue illustration centered on the navy disc.

Product — e.g. Guardian

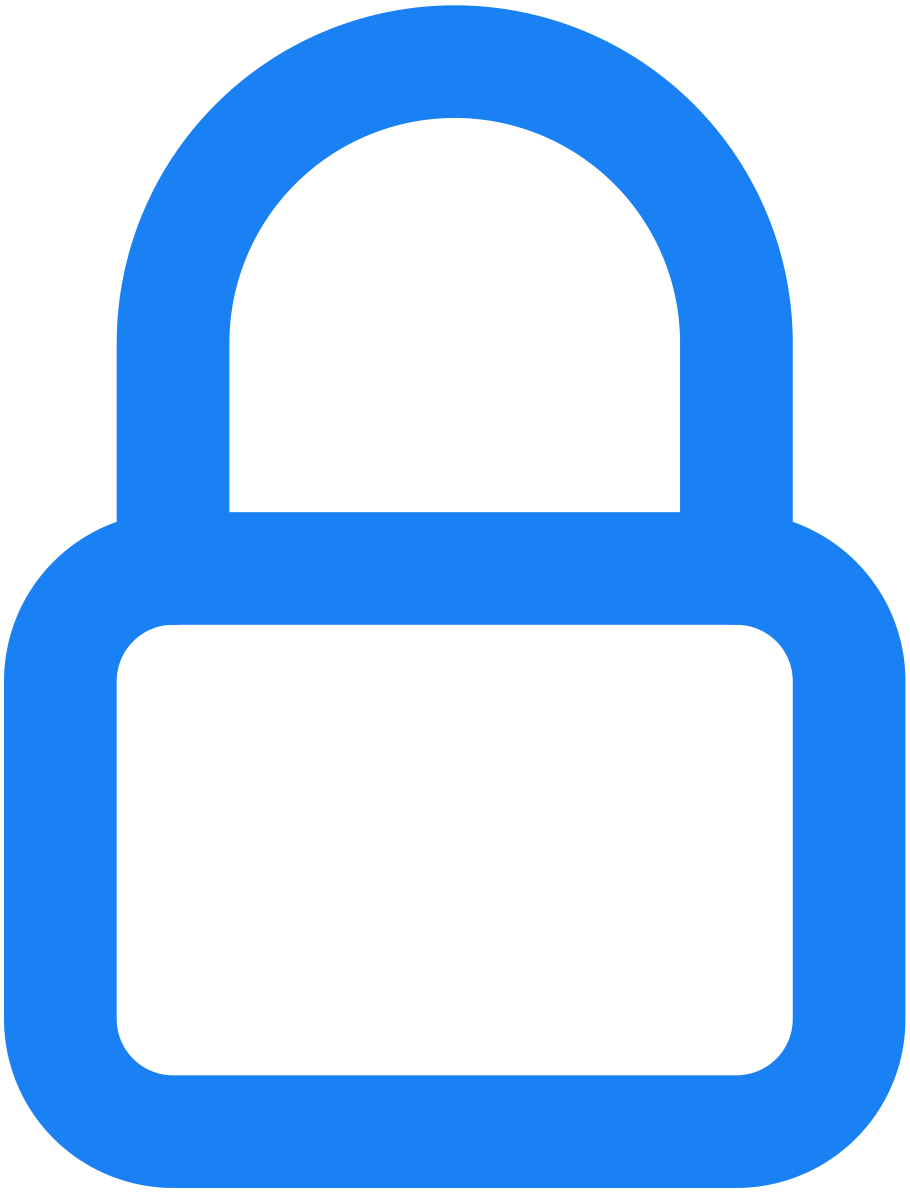

Market segment — e.g. Health systems

Product — e.g. Semantic

Icon badges

Optional capability tags on the ring. Use at most two, in the two weights below, to signal a feature (security, exchange, automation). Keep them off faces and clear of the halo's densest dots.

Light badge

White fill, blue ring, blue icon

Dark badge

Blue fill, white ring, white icon

Do

- Keep the ring even and the halo fading softly to nothing.
- One badge per hero; photo for people, illustration for products and segments.
- Center the fill; give a photo its navy band so it doesn’t touch the ring.
- Hold icon badges to two, at opposite corners, clear of the face.

Don’t

- Don’t crop the halo to a square or let it end in a hard edge.
- Don’t recolor the ring; it stays navy with the blue edge.
- Don’t crowd the disc with more than one subject or stack many badges.
- Don’t mix a photo and an illustration inside one badge.

MASTER-ART RULE

Use the approved hero-badge master art (photo rings and segment illustrations) as provided. Recreate the ring and halo only from the spec above when a live element is genuinely needed.

Display ads

Display units are **billboard-simple**: Rhapsody Blue leads (it reads best in display; navy is the occasional alternate), the logo is prominent, a few large words carry one quick read, and there is one action. The full system is available, but restraint wins the placement. One in-context example is shown below; exhaustive per-size placement specs live with the paid-media team, not in this guideline.

In context

300×250 medium rectangle: Rhapsody Blue ground, white wordmark, one short headline, one CTA, big dot in the corner clear of copy.

- **Blue-first ground.** Rhapsody Blue is the default; navy is the occasional alternate. White logo on both.
- **Logo leads, always.** The wordmark is prominent in every unit; use the monogram only where the wordmark won't fit (≤50px tall). Never small or buried.
- **Few, large words.** Billboard logic, a short headline read in seconds. Cut words before you shrink type; 13px floor at delivered size.
- **One device, one action.** One device max, photo, fluid dot pattern, big dot, or nothing, clear of the copy, and a single CTA (a pill, or an arrow chip in tight formats).

KEEP IT TO ONE READ

If a unit needs more than a glance, it's doing too much. Trim to the logo, one line, and one action; let the blue ground and a single device do the rest.

TEMPLATES

PowerPoint deck template

The official Rhapsody slide deck template (2026), on the current brand: Poppins for headings and body, IBM Plex Mono eyebrows, Rhapsody Navy `#0B2C47` grounds, and the approved layout catalog (title, agenda, content, data, quote, timeline, stats and closing slides). It is a **PowerPoint file you download and edit in PowerPoint**, not a web component — build decks from it rather than from a blank file.

DOWNLOAD

Master file: **downloads/Rhapsody-PowerPoint-Template-2026.pptx** — 65 slides. Start every Rhapsody deck from this template; never rebuild the layouts, colors or type.

Using it

- Pick a layout from the catalog and fill in content — don't alter colors, fonts, or structural elements.
- Poppins Light/Regular for body, Medium for emphasis; eyebrows and labels in IBM Plex Mono.
- Keep to three brand colors per slide; flat color only, no gradients.
- White logo on navy/blue grounds, blue-black logo on light.

The web design system (these cards) governs color, type, logo, devices and patterns; this deck applies that system to slides. For digital display formats see **Display ads**.

Email signature

A consistent employee signature keeps everyday email on brand. Keep it text-based and simple so it renders in every client: the wordmark, a thin teal divider, then the name lockup and contact lines. Use Poppins where the client supports it, with Arial as the fallback. Set copy in navy, dark gray, and Rhapsody Blue on a white background; don't add background colors, images behind text, or quotes.

rhapsody.health →

- **Wordmark.** Use the primary logo (navy bar, blue wordmark) at roughly 120–140px wide on the white signature. Never stretch, recolor, or drop a glow behind it. In tight signatures the R monogram may stand in.
- **Divider.** One thin teal rule about the cap height of the wordmark separates the logo from the text, the same device as the co-brand lockup. No box around either element.
- **Name lockup.** Name in Poppins Medium (500) navy, then title in Regular (400) dark gray. Don't repeat the company name in the text; the wordmark lockup to the left already carries it.
- **Contact lines.** Phone and email in dark gray; the website as an actionlink ending in a trailing arrow (`rhapsody.health →`) in Rhapsody Blue. Keep everything at least 12px.
- **Keep it clean.** No quotes, taglines set as images, banners, or social icons in unapproved colors. If a campaign banner is required, use an approved template rather than building one inline.
- **Certifications (required roles).** Some roles must display compliance badges (for example Cyber Essentials Plus or ISO 27001) — see below.
- **Company name.** Always "Rhapsody," never "Rhapsody Health."

With required certifications

Where a role must show compliance badges, add them in a row below the signature, separated by a thin divider. Both current badges are **stacked (vertical) lockups**, so size them to a consistent height of about **44px** with even spacing. The frames below show placement and size; drop in the official issued badge art (transparent background) in place of each frame. Host it like the logo, and never stretch, crop, or recolor a certification mark.

rhapsody.health →

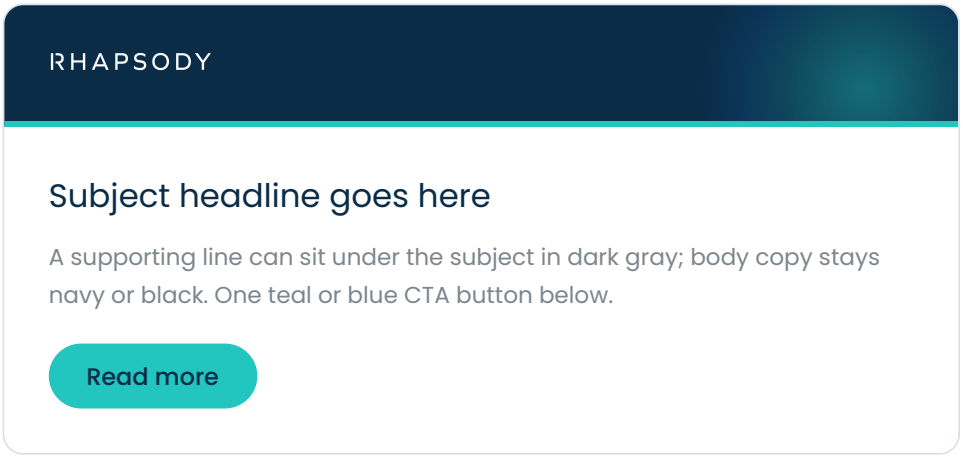

CERT BADGE CERT BADGE

stacked badges, ~44px tall

Certification row below the signature: stacked badges at a consistent ~44px height, even spacing, official art on a transparent background.

Email

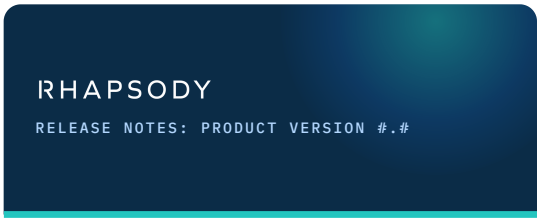

Email uses the same system as the web: a navy header band carrying the wordmark and an Aurora glow, the seam where the header meets the body, then copy on a clean white body. Keep one message and one primary action per send.

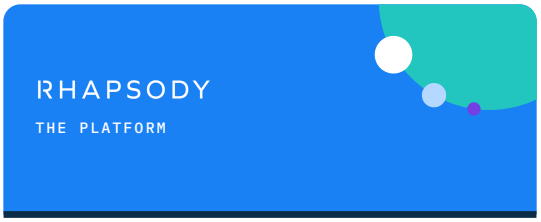

- **Header.** Navy band with the white wordmark and an optional Aurora glow offset to one side. Add the program or series name (for example, a “Release Notes” or newsletter series) in light blue beneath the wordmark. Close the band with the seam (see Layout & spacing for its color).
- **Body.** Navy or black body copy on white, Poppins, generous line spacing. Glows and dot patterns stay in the header, not behind body text.
- **One CTA.** A single primary button, teal on the light body. Secondary links can be inline text in Rhapsody Blue.
- **Imagery.** Follow the photography rules; portraits use the thin-ring treatment. Keep the clear margin around any graphic.
- **Accessibility.** Maintain the 3:1 minimum contrast; don't set long copy in light blue or teal on white.

Banner layouts

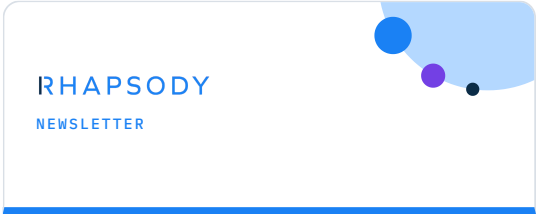

The header band is where the system gets to breathe, so vary the device to fit the send. All of these are acceptable: they keep the wordmark, an optional program name, and the seam, and change only the graphic device and background. One device per banner, offset from the wordmark.

Navy + Aurora glow (default), for atmosphere.

Rhapsody Blue + big dot, navy seam.

Big dot on white (primary logo, blue seam).

Photography: subject in the open right of frame, head clear; copy and an optional customer logo on the scrimmed left.

Building for email

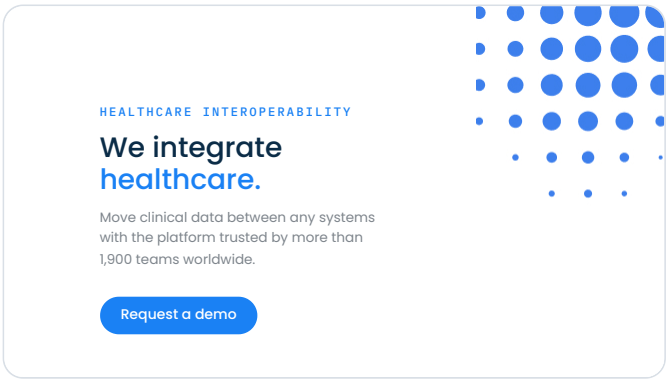

- **Subject & preheader.** One clear subject in brand voice, front-loading the value (around 40 characters); write the preheader as a real complement to it, never "View in browser."
- **Images off by default.** Many clients block images, so never lock the core message or the CTA inside an image. Set the headline and button as live HTML text, and give every image alt text, including the wordmark.
- **Width.** Keep the content column around 600px so it renders reliably across clients and on mobile.
- **Dark mode.** Assume some clients recolor. The navy header with the white wordmark (transparent PNG) holds up; avoid dark type on transparent PNGs that can invert into dark-on-dark.

PARDOT & CLIENT RENDERING

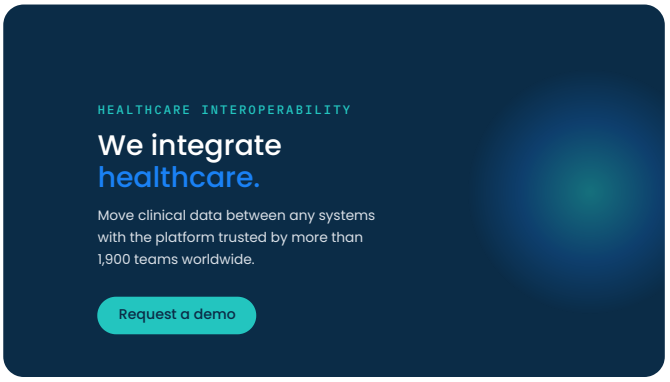

- **Build for Pardot (Account Engagement).** Use a table-based layout with inline styles (like the signature), a single ~600px column, and hosted images in Pardot. Include the required merge fields, unsubscribe link and mailing address, and keep handlebars/merge tokens out of the visible design.
- **Fonts degrade, don't embed.** Poppins won't load in most inboxes, so set `font-family:'Poppins',Arial,Helvetica,sans-serif` and design so the Arial fallback still looks right. Don't ship copy baked into images to force the font.
- **Outlook (Windows) uses Word to render.** Stick to tables, avoid CSS `background-image` (put the navy header color on a table cell, with the glow/dots as a hosted image), and expect `border-radius` to square off, so use bulletproof table-cell buttons (VML for a rounded pill) rather than a CSS pill.
- **Gmail.** Keep the HTML lean, Gmail clips messages over ~102KB ("View entire message") and favors inline styles. Test in Gmail web and the mobile app alongside Outlook.

Hero type in context

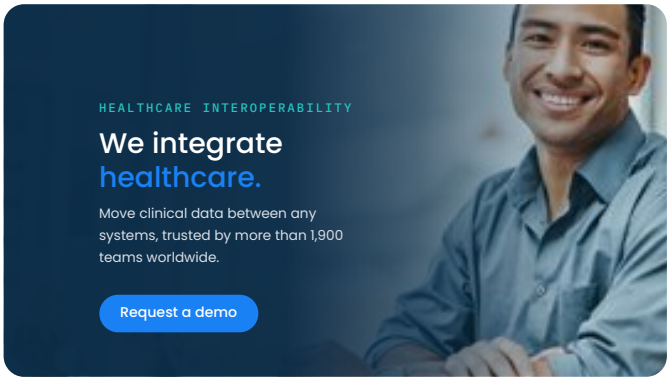

The hero pattern pairs an eyebrow, a headline with one accent word, a short supporting line, and one pill button with a single visual. The specs are below.

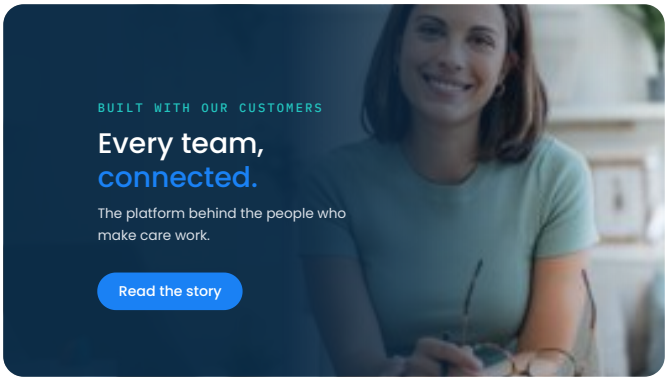

Light mode: navy headline, blue accent word, fluid dot pattern in the top-right.

Dark mode: white headline, Rhapsody-blue accent word (large enough to stay vibrant on navy), teal eyebrow, glow right.

Photography: same layout as above with a photo as the visual, the subject held to the right and a navy scrim on the type side so the copy stays legible.

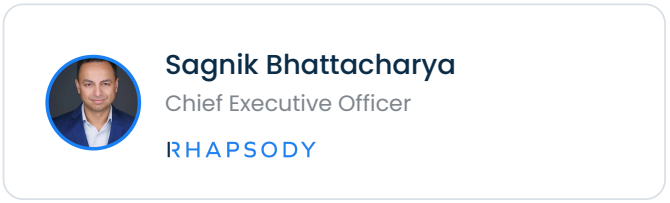

Photography, people-led: same layout, the team photo held to the right with a navy scrim on the type side.

- **Length caps:** hero headline no more than 40 characters; supporting line no more than 110 characters (about two short lines). If it doesn't fit, cut the copy, not the type size.
- Eyebrow in IBM Plex Mono (blue on light, teal on dark), headline in Poppins Medium (500) with one accent word, one pill button.
- One visual only: a single device offset right and clear of the copy, or a photo with a scrim behind the type. Never a device and a photo together.

Name lockup

The name lockup attributes a person on speaker graphics, webinar promos, event cards, and testimonials, in three stacked lines. Name in Poppins Medium (500), title in Poppins Regular (400) dark gray; the company line and portrait pairing follow the rules below.

Standalone name card: the company line is the Rhapsody logo.

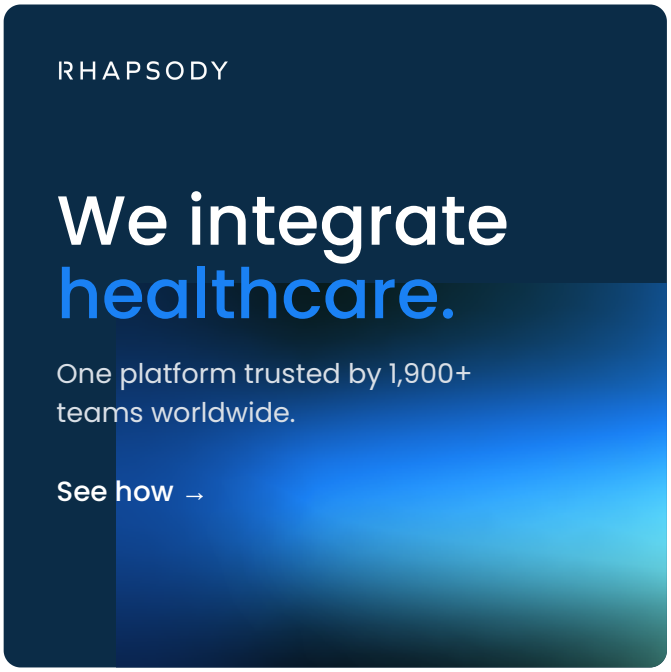

Embedded in an asset that already shows the logo: the company line is the written name, so the logo isn't repeated.

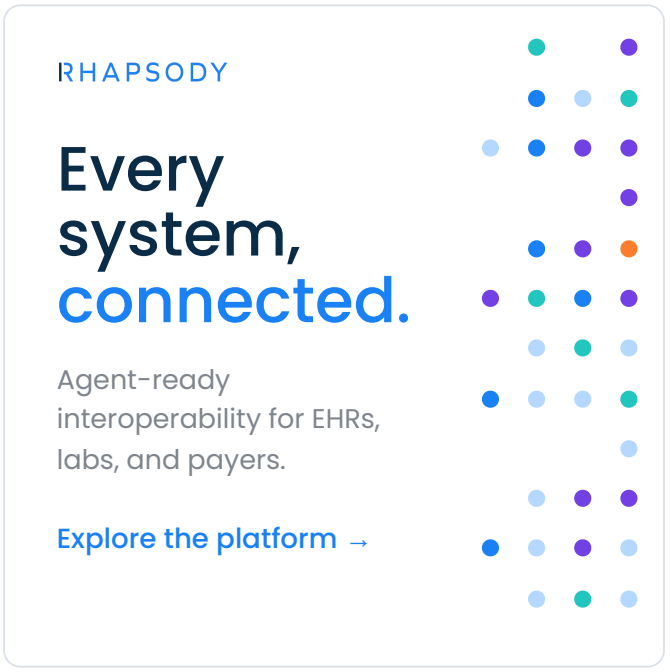

- Order is always name → title → company; never reorder or merge lines.
- Company line: use the **Rhapsody logo** in a standalone name card; use the **written name "Rhapsody"** (Poppins Medium (500), Rhapsody Blue; light blue on dark grounds) when the card sits in an asset that already shows the logo, so the logo never repeats.
- Titles follow the person's actual title; don't abbreviate or retitle for fit; reduce size instead.
- On light, pair the lockup with the thin-ring portrait.
- On dark, use the event card pattern: eyebrow, session title, date/time line, then the lockup.
- Date and time formatting follows Typography → Dates and times.

Social

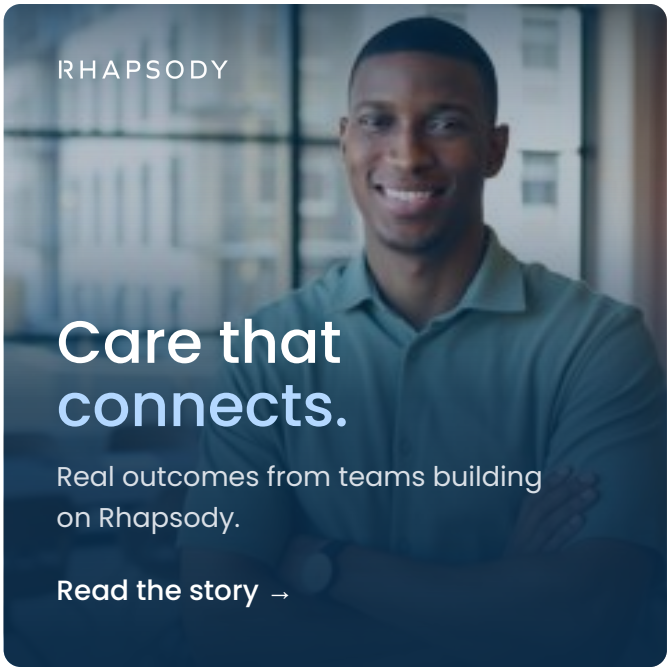

Social posts are single-idea and built from the core system: one message, one visual. Lead with a light device, the dots, or a photograph; the specifics are below.

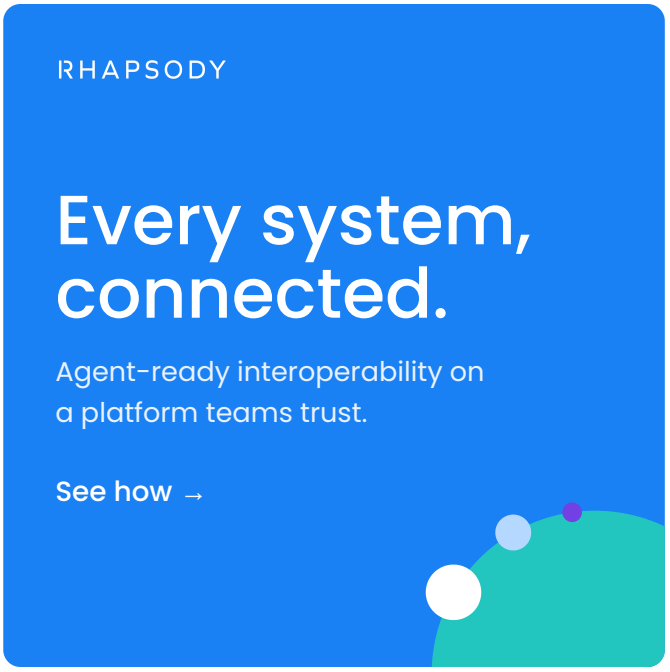

1:1 post, light device (Aurora). Full canvas: mobile-size headline, one support line, a text-link CTA, copy clear of the glow.

1:1 post, dot accent. Same structure on white: multicolor fluid dot pattern from the right edge, copy in navy and blue.

1:1 post, photography-led. Bottom navy scrim carries the wordmark and copy; the photo is the visual, no device.

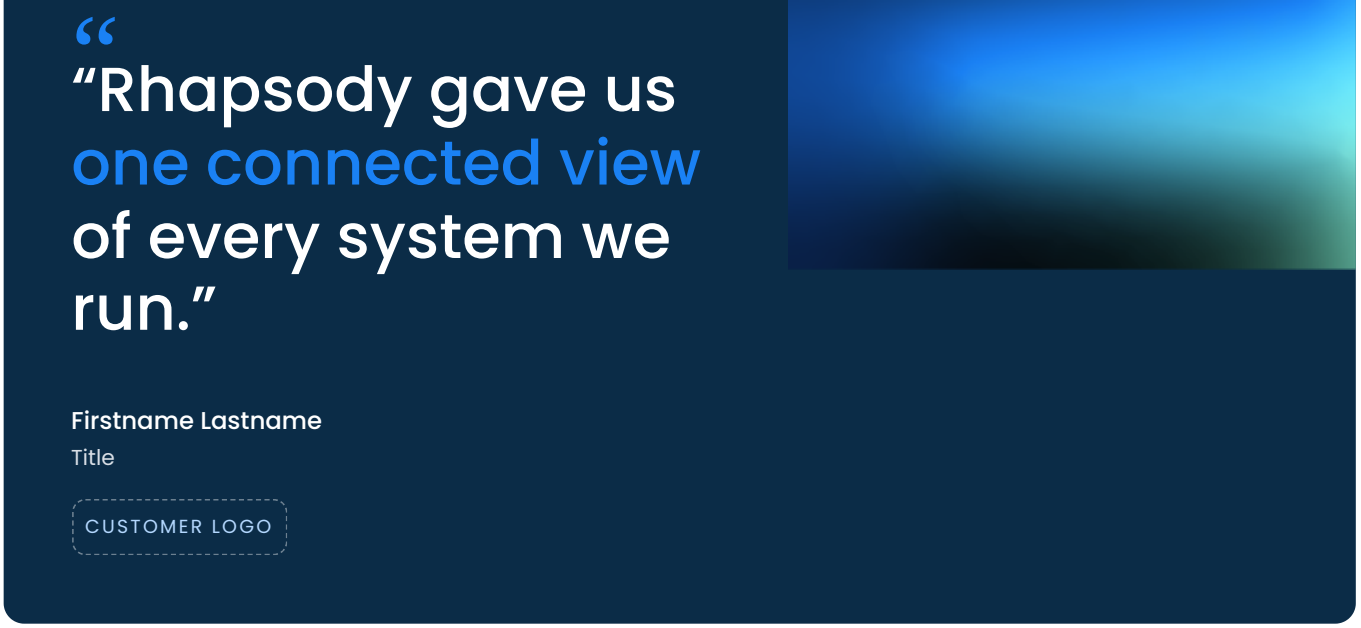

1:1 post, Rhapsody Blue. Big dot device offset to the corner, white copy, one text-link CTA (dots on blue, never a light device).

Quote banner

A landscape quote banner pairs one short customer line with the **Aurora** glow, for profile and channel headers, in-feed landscape posts, and slide headers. One device, copy clear of the glow.

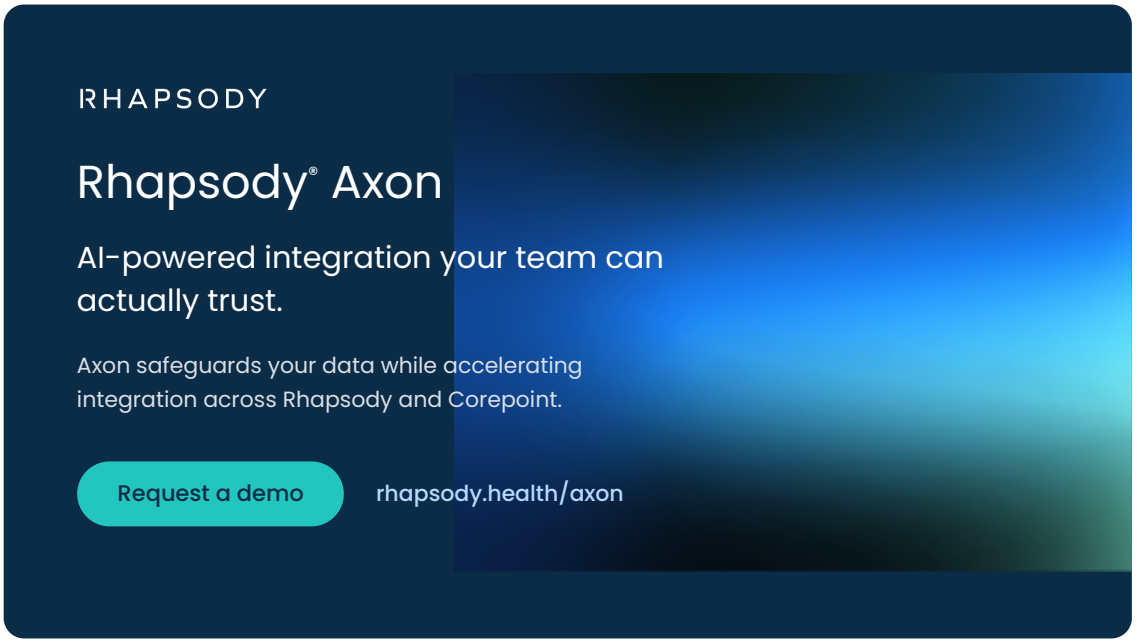

Landscape quote banner: one customer line with an emphasized phrase, the name lockup with logo, and the Aurora glow in the open space, clear of the copy.

- **One idea per post.** A short Poppins Medium (500) headline with a single emphasized line; let the visual carry the rest.
- **Fill the canvas.** Headline sized for mobile feeds, one support line, and a text-link CTA with the arrow. Avoid large empty zones; let the device anchor the composition.
- **One visual.** A light device, dots, or a photograph, never combined. Glows stay teal, blue, or purple; dots stay structured and may include a few orange accents; photos follow the photography rules with a scrim behind copy.
- **Formats.** Design for 1:1 (feed) and 9:16 (stories and reels) from the same layout; keep copy and the wordmark inside a safe margin clear of platform UI.
- **No seam.** The teal separator is only for pieces that border other content (web hero, email header), not standalone posts.
- **Legibility.** Keep text off the brightest part of a glow and honor the 3:1 contrast minimum.

Product launch announcement

A launch announcement introduces a new product or capability in one confident unit: the product name, a plain-language line on what it does, a short support sentence, and a single call to action. Set it on navy with an **Aurora** glow for the breakthrough moment, with copy on the calm side.

Launch (Aurora): a calm wash offset right; product name and copy on the calm left.
Example: a Rhapsody Axon launch.

- **Product name leads,** set in the name lockup (with the ® where registered), followed by one plain-language line on what it does.
- **Aurora on navy.** One light device, the Aurora glow, offset into open space with copy on the calm side; light devices are navy-only. Keep the glow within teal, blue, and purple.
- **One CTA.** A single action (a teal or Rhapsody Blue pill) plus the product URL; no competing buttons.
- **Keep it tight.** Name, one-line promise, one support sentence, one CTA—nothing more; let the glow carry the energy.
- **Formats.** Design the 16:9 for web heroes, slides, and email headers; hold the wordmark and copy inside a safe margin.

Quick corrections log

× RETIRED Do not use

Treatments from the earlier brand guide, retired for all new work. No exceptions.

- **Busy circle / photo / icon-overlay montages** — the composite hero of headshots orbiting an illustration with floating speech bubbles and shapes. Use real photography with the modern treatments, the fluid dot pattern, or an approved Aurora master.
- **Legacy line-art / spot illustrations and character-driven cartoon scenes** — including outlined "person + cloud + lock" artwork, whimsical people, and juvenile spot illustrations. Replace with photography, product/interface imagery, diagrams, data visualization, or approved abstract devices.
- **Two-tone / two-color icons** — including icon-on-circle art. Replaced by the single outline family (stroke-only, 1.7 weight, currentColor).
- **Thick color rings around headshots / people** — no thick ring anywhere, no exceptions. Portraits use the thin ring, arc accent, rounded-rectangle card, or editorial split.
- **Squiggle line with dots** — the wandering hairline path with colored nodes. Use the fluid dot pattern or Aurora.
- **Burst and Plexus light devices** — retired. The light device is now **Aurora only** (one glow, soft to flowing). Anywhere Burst or Plexus appeared, use the Aurora glow.
- **Scattered / structured dot field** (the earlier 45-composition grid family) — retired and replaced by the **Fluid dot pattern**. Use the approved fluid-pattern masters; don't reuse the old `df-*` field art.
- **Aurora ribbon as a separate register** — retired as a distinct item. Aurora is now one device that allows movement; the flowing form is part of it, not a second device.

Changelog (October 2026)

- **Scattered dot field replaced by the Fluid dot pattern.** The structured scattered field is retired across the system. Its successor is the **Fluid dot pattern**, a half-tone dot grid that flows dense-to-sparse, with the same registers (white on navy, white on blue, dots on white, multicolor on navy) plus a two-tone **color-territory split** that replaces hard color blocking. New verbatim masters live in Devices → Fluid Dot Pattern; the old `df-*` field art is removed.
- **Aurora merged into one device.** The Aurora wash and the Aurora ribbon are no longer two registers; Aurora is a single light device that **allows movement**, from a soft wash to a flowing form. New verbatim Aurora masters folded in. Still navy-only, teal-led, teal / blue / purple.
- **Light devices reduced to Aurora.** Burst and Plexus are retired. Everywhere Burst or Plexus was used (product launch, social quote banner, devices overview), switch to the Aurora glow.

Latest updates (October 2026)

- **Teal is immutable.** Small teal applications on light grounds were failing contrast checks and getting darkened in production — creating off-brand second teals. The ruling: #23C5BF is the only teal, never darkened, tinted, or theme-converted to pass a check. When a teal application fails contrast, change the *ground* or the *role*, never the hex. Full rules and demos in Color → Teal in small applications.

- **Teal type on navy only.** Eyebrows, labels, actionlinks, and small icons may be teal on navy (6.7:1, passes at any size). On white or gray-blue there is no teal type: automation actionlinks stay Rhapsody Blue, and the teal cue is carried by an accent — the module accent line, the teal seam, or the new **teal tick** (a 16×3px teal bar before a navy mono label, the approved pattern for pathway-coded labels on light grounds). This scopes the July 2026 “teal actionlink in automation contexts” allowance below to dark grounds.
- **Teal-filled pill retired.** The primary-on-dark button is a Rhapsody Blue fill with a white label; the teal pill required a label set on teal, which September 2026 removed at any size. See Buttons & CTAs.
- **Framework visuals on the web are built, not pictured.** Concept and architecture diagrams on web pages are embedded as native, responsive HTML — real text that reflows at every width — never as an image inside a screenshot or browser frame. The framed-media treatment is reserved for what genuinely is a screen or artifact: product UI, demo video, an audit record, a sample deliverable. First application: the Build + Automate architecture framework on the Solutions pages (web-style.md §6, §9); the Claude Design image master remains the source for decks, PDFs, and social.

Changelog (September 2026)

- **Contents.** Added "Brand Expression" section & "Illustration" section.
- **New "Brand Expression" section:** Introduces brand goals.
- **Color palette.** Tertiary color use tightened; purple and Orange are no longer general-purpose, should only be used for accents, emphasis, or data visualization. Added more specific data on color accessibility as well as approved color pairings. Removed "text on teal" allowance; even though black text on teal passes accessibility, it's not visually appealing and should be omitted.
- **Typography.** Changed leading & tracking guidelines to make them easier to follow. Also added a rule that if content doesn't fit a section, change the copy - don't tighten the text to make it fit.
- **Charts & graphs.** Added a note that the same color order is being used for both charts and pathways. (It originally mentioned it was two different orders, which was not accurate.)
- **Graphic devices at a glance.** Rewrote section with stricter rules to make usage more clear.
- **Icon library.** Provided stricter rules on icon tile color usage, with an added visual sample.
- **New "Illustration" section:** Discussions the retirement of old illustration styles & reviews new image styling.
- **Photography & portraits.** Added more context on tech-focused photography, favored over healthcare-focused photos.

Latest updates (July 2026)

- **Logo bar is now Rhapsody Navy, locked in.** The primary lockup bar is #0B2C47 (not black), baked into the artwork so it cannot revert.
- **New dark-background lockup:** the blue wordmark with a white line accent, used on navy at larger sizes (about 240px / 2.25in wide and up); below that, the all-white wordmark. See Logo & wordmark.
- **Light blue refreshed to #B4D8FF** (lighter, less saturated), replacing #90C5FF across the system.
- **Text on teal:** use navy or black only, never white (white is 2.1:1 and fails at any size). Minimum 16px body, 14px labels, 12px floor. See Color.
- **The type hierarchy is one weight, Poppins Regular (400).** H2–H4 and body copy all set in Regular; the hero and H1 step up to Medium (500), which also carries short standalone “moment” headlines. See Typography.

- **Two-tone headline is for emphasis only:** color just the highlighted word(s); the rest of the headline and the description stay white or black per background. Use sparingly.
- **Graduated dot field retired.** The uniform scattered field is the single dot pattern for backgrounds.
- **Module accent-line color stays consistent across an activation:** pick blue or teal and hold it across every slide/surface; don't switch mid-set.
- **Employee email signature added.** See Email for the wordmark, teal divider, name lockup, and contact lines.

Direction confirmed, superseding earlier drafts

- **Multicolor dots are approved.** Both white-on-blue and multicolor are equal, on-brand registers for digital and physical. An earlier draft wrongly labeled multicolor off-brand.
- **Dots are always structured.** Apply the uniform scattered field (equal-size dots, densest at an edge and thinning inward), never a random scatter. The size-graduated grid is retired; see Primary graphic devices.
- **Squiggle and icon-on-circle illustrations are retired for new work,** even though both appear in the brand guide.
- **The heavy photo color-ring is retired.** Portraits now use the modern treatments (thin ring, arc accent, card, or editorial split), which supersede the thick-ring application from the earlier brand guide.
- **Photography:** bright and natural-lit. Avoid dark imagery, blur, and harsh light flaring at the camera.
- **Iconography moved to a single outline family (adopted from the homepage prototype, July 2026):** stroke-only, 1.7 weight, currentColor, 44px gray tile for feature icons; check/cross functional marks at weight 3. The two-color line icons are superseded for new work.
- **New approved treatments added:** bracket logo treatment, dot row accent, white-plus-light-blue headline on dark, and the teal separator line.
- **Module accent line (adopted from the homepage prototype, July 2026):** a 44×3px, 2px-radius bar above each H2 module: blue for build contexts, teal for automation, never orange; one per module, never full-width.
- **CTA arrow on text links (adopted from the homepage prototype, July 2026):** secondary/tertiary text links end with a trailing →; buttons never take an arrow. Teal (#23C5BF) is the actionlink color in automation contexts, an approved exception to "no teal copy."
- **Copy length caps (July 2026):** hero headline ≤40 characters, hero supporting line ≤110, quote snippets ≤60, testimonials ≤120.
- **Brand Identity Evolution approved and folded in:** the light-based graphic devices (Aurora and the Aurora ribbon; Burst and Plexus retired October 2026; the Aurora-Burst hybrid retired; formerly grouped as "Radiance") and the modern real-people headshot treatments (thin ring, arc accent, rounded-rectangle card, editorial split). The thick color-ring is fully retired with no exceptions; see "Do not use."
- **Eyebrows and technical annotations moved to IBM Plex Mono (July 2026),** retiring the Poppins Medium uppercase eyebrow treatment. See Typography.
- **Date, time, and name-lockup formats added (July 2026).** See Typography for the formats: Jan 4, 2026 · 10-11 a.m. EST | 9-10 a.m. CST · name / title / company stacked lockup.

A modified, AI-ready version of the official Rhapsody Brand Guideline (2026), reflecting the latest brand evolutions through September 2026. Company name is always Rhapsody, never Rhapsody Health, and never possessive (no "Rhapsody's"); rewrite to avoid the possessive form.
